# 0. INTRODUCTION

## 0.1 SI UNITS AND CONVERSION EQUATIONS

Table 0A

Description	Formular symbols	SI Unit symbol	Unit name	Conversion equations
Distance	$L$	m	metre	
Area	$A$	$\text{m}^2$		
Volume	$V$	$\text{m}^3$		
Angle in one plane	$\alpha, \beta, \gamma$	rad	radian	$1^\circ = \frac{\pi}{180}$ rad $1' = 1^\circ/60$ $1'' = 1'/60$
Time	$t$	s	second	
Frequency	$f$	Hz	Hertz	$1\text{Hz} = 1/\text{s}$
Speed	$n$	1/min		
Velocity	$v$	m/s		
Angular velocity	$\omega$	rad/s		
Acceleration	$a$	$\text{m}/\text{s}^2$		
Angular acceleration	$\alpha$	$\text{rad}/\text{s}^2$		
Mass	$m$	kg	kilogram	
Density	$\rho$	$\text{kg}/\text{m}^3$		
Force	$F$	N	Newton	$1\text{N} = 1\text{kg} \cdot 1\text{ m/s}^2$ $9.81\text{ N} = 1\text{ kgf}$
Pressure	$p$	$\text{Pa} = \text{N}/\text{m}^2$	Pascal	$9.81 \cdot 10^4 \text{ N/m}^2 = 1\text{kgf/cm}^2$ $9.81 \text{ N/mm}^2 = 1\text{ kgf/mm}^2$
Work done	$W$	$J = \text{Nm}$	Joule	$9.81 \text{ Nm} = 1\text{ kgfm}$ $4187 \text{ J} = 1\text{ kcal}$ $1\text{ kWh} = 3.6 \times 10^6 \text{ J}$
Energy	$W$			
Thermal quantity	$Q$			
Torque	$M$	Nm		$9.81 \text{ Nm} = 1\text{ kgfm}$ $1\text{ Nm} = 0.102\text{ kgfm}$
Power	$P$	$\text{W} = \text{J/s} = \text{Nm/s}$	Watt	$735.5\text{ W} = 1\text{ hp}$
Moment of inertia	$J$	$\text{kg m}^2$		$9.81 \text{ kg m}^2 = 1\text{ kpm s}^2$ $\text{PD2} = 4\text{ J}$
Dynamic viscosity	$\eta$	$\text{Pa} \cdot \text{s}$		$10^{-1}\text{ Pa} \cdot \text{s} = 1\text{ P (Poise)}$
Kinematic viscosity	$\nu$	$\text{m}^2/\text{s}$		$10^{-4}\text{ m}^2/\text{s} = 1\text{ St (Stokes)}$
Electric current	$I$	A	Ampere	$1\text{ A} = 1\text{ W/V} = 1\text{ V/A}$
Electric voltage	$U$	V	Volt	$1\text{ V} = 1\text{ W/A}$
Electric resistance	$R$	$\Omega$	Ohm	$1\text{ }\Omega = 1\text{ V/A} = 1/S$
Electric conductivity	$G$	S	Siemens	$1\text{ S} = 1/\Omega$
Electric capacity	$C$	F	Faraday	$1\text{ F} = 1\text{ C/V}$
Charge	$Q$	C	Coulomb	$1\text{ C} = 1\text{ A} \cdot \text{s}$
Inductance	$L$	H	Henry	$1\text{ H} = 1\text{ Vs/A}$
Magnetic flux density	B	T	Tesla	$1\text{ T} = 1\text{ Wb/m}^2$
Magnetic field strength	H	$\text{A}/\text{m}$		
Magnetic flux	$\Phi$	Wb	Weber	$1\text{ Wb} = 1\text{ V} \cdot \text{s}$
Temperature difference	$\vartheta$	$\text{K}$ $^\circ\text{C}$	Kelvin	$0\text{ K} = -273.15\text{ }^\circ\text{C}$

## 0.2 ENGINEERING FORMULAE FOR MOTOR DRIVES

Power (3-phase motors)	Torque from motor power	Factor of Inertia FI
<p>P<sub>1</sub> = power input = <math>U \cdot I \cdot \cos \phi \cdot \sqrt{3} \cdot 10^{-3}</math> [kW]</p> <p>P<sub>2</sub> = power output = P<sub>1</sub> • η [kW]</p> <p>Where:</p> <p>U = voltage [V]</p> <p>I = current [A]</p> <p>cos φ = power factor</p> <p>η = efficiency</p> <p><b>Power requirements of some applications</b></p> <p>Lifting:</p> $P = \frac{m \cdot v}{\eta} \cdot 9.81 \cdot 10^{-3}$ [kW] <p>Rotation:</p> $P = \frac{M \cdot n}{9550 \cdot n}$ [kW] <p>Fan and pump drives:</p> $P = \frac{H \cdot Q}{\eta}$ [W] <p>Where:</p> <p>P = power [kW]</p> <p>m = mass [kg]</p> <p>v = speed [m/s]</p> <p>n = rotational speed [<math>\text{min}^{-1}</math>]</p> <p>η = efficiency</p> <p>M = torque [Nm]</p> <p>Q = output [<math>\text{m}^3/\text{s}</math>]</p> <p>H = head [<math>\text{N/m}^2</math>]</p>	<p>M = <math>9550 \cdot \frac{P_2}{n}</math> [Nm]</p> <p>Where:</p> <p>P<sub>2</sub> = motor output [kW]</p> <p>n = motor speed</p> <p>Conversion of torque for step-up and step-down speed ratios:</p> $M_2 = \frac{M_1 \cdot n_1}{n_2}$ <p>Where:</p> <p>n<sub>1</sub> = motor speed [<math>\text{min}^{-1}</math>]</p> <p>M<sub>1</sub> = motor torque at n<sub>1</sub> [Nm]</p> <p>n<sub>2</sub> = speed of load [<math>\text{min}^{-1}</math>]</p> <p>M<sub>2</sub> = torque of load at n<sub>2</sub> [Nm]</p> <p><b>Moment of Inertia J</b></p> <p>Moment of Inertia of a cylindrical flywheel:</p> $J = \frac{md_2}{8}$ <p>Where:</p> <p>m = mass [kg]</p> <p>d = flywheel diameter [m]</p> <p>Effective moment of inertia on the motor of a linearly moved load:</p> $J = 91.2 \cdot m \cdot \left(\frac{v}{n}\right)^2$ <p>Where:</p> <p>m = mass [kg]</p> <p>v = velocity [m/s]</p> <p>n = motor speed [<math>\text{min}^{-1}</math>]</p> <p>Conversions of moments of inertia for step-up or step-down speed ratio:</p> $J_2 = J_1 \cdot \left(\frac{n_1}{n_2}\right)^2$ <p>Where:</p> <p>n<sub>1</sub> = motor speed</p> <p>J<sub>1</sub> = moment of inertia at n<sub>1</sub></p> <p>n<sub>2</sub> = speed of load</p> <p>J<sub>2</sub> = moment of inertia</p>	<p>FI = <math>\frac{J_{\text{mot}} + J_{\text{load}}}{J_{\text{mot}}}</math></p> <p>Where:</p> <p>J<sub>mot</sub> = moment of inertia of motor</p> <p>J<sub>load</sub> = moment of inertia of load</p> <p><b>Starting time t<sub>a</sub></b></p> $t_a = \frac{FI \cdot J_{\text{mot}} \cdot n}{9.55 \cdot (M_{\text{mot}} - M_{\text{load}})}$ <p>Where:</p> <p>FI = Factor of inertia</p> <p>J<sub>mot</sub> = moment of inertia of motor [<math>\text{kgm}^2</math>]</p> <p>n = motor speed [<math>\text{min}^{-1}</math>]</p> <p>M<sub>mot</sub> = motor torque during starting (mean) [Nm]</p> <p>M<sub>load</sub> = counter torque of load during starting (mean) [Nm]</p> <p><b>Speed</b></p> <p>The no-load speed is virtually the same as the synchronous speed. The synchronous speed of the motor is calculated as follow:</p> $n_s = 120 \cdot f/p$ [ $\text{min}^{-1}$ ] <p>Where:</p> <p>f = frequency [Hz]</p> <p>p = number of pole</p> <p>The synchronous speed is reduced by the slip (S) to the rated speed:</p> $n_n = n_s \cdot (1-S)$ [ $\text{min}^{-1}$ ]

### 0.3 STANDARDS AND SPECIFICATIONS

Flameproof motors conform to the following standards and specifications:

**Table 0B**

TITLE	INTERNATIONAL IEC®*	EU CENELEC®*
Electrical rotating machines/rated operation and characteristic data	IEC 60034-1	EN 60034-1
Methods for determining losses and efficiency of rotating electrical machines	IEC 60034-2	EN 60034-2

Electrical equipment for hazardous areas Increased safety "e"	IEC 60079-7	EN 60079-7
Equipment with protection type "t" for use in the presence of flammable dusts	IEC 60079-31	EN 60079-31

## 0.4 PROTECTION AGAINST EXPLOSIONS IN DANGEROUS AREAS

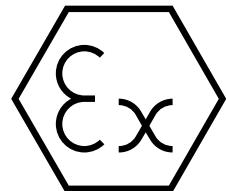

### 0.4.1 TYPES PROTECTION

The use of an electrical apparatus in potentially explosive atmospheres is quite usual today. This equipment has to be manufactured in such a way that there is no risk of explosion.

An explosion occurs when of the three following conditions happen:

- Presence of a potentially explosive atmosphere;
- Possibility of transmission of the explosion;
- Existence of an ignition source.

The recognized types of protection eliminate one of these conditions and thus make an explosion impossible.

**Fig. 0A** - Specific marking for protection against explosions - Directive 2014/34/EU.

### Protection methods for GAS

Two types of protection prevent the presence of a potentially explosive atmosphere inside the electrical apparatus:

- Oil immersion (safety "ob", "oc", "op");
- Pressurized apparatus (safety "pv", "pxb", "pyb", "pzc").

Two types of protection make the transmission of an internal explosion to the potentially explosive atmosphere surrounding the electrical apparatus impossible:

- Sand filling (safety "q");
- Flameproof enclosure (safety "db").

Lastly, three types of protection eliminate any source of ignition, such as sparks, overheating, etc.:

- Increased safety (safety "eb", "ec");
- Intrinsic safety (safety "ia", "ib", "ic");
- Protection "nA", "nC", "nR" (restricted to zone 2).

### Protection method for flammable dusts

For flammable dusts, only one method of protection is provided for:

- Housing which prevents the infiltration of dust and surface temperature limitation (protection type "tb", "tc").

### Protection method for electric motors

In practice only five of these eight methods of protection are applicable to the electric motor:

- Pressurized apparatus (symbol Ex pv, Ex pxb, Ex pyb, Ex pzc);
- Flameproof enclosure (symbol Ex db);
- Increased safety (symbol Ex eb, Ex ec);
- Non sparking protection (symbol Ex nA);
- Protection by a housing (symbol Ex tb, Ex tc).

Electric motors have another method of protection for gas (symbol Ex db eb) which is a combination of:

- Flameproof enclosure "db" for motor frame;
- Increased safety "eb" for terminal box.

## 0.4.2 DANGEROUS AREAS AND ZONES

Dangerous areas include any area in which explosive atmospheres may occur under specific conditions. An explosive atmosphere is a mixture of air and combustible gases, vapours, fumes or dust under atmospheric conditions where combustion expands itself (explosion) after ignition.

Only local authorities can classify hazardous areas. The users shall classify the hazardous areas as indicated in the European directive 1999/92/EC under their own responsibility.

International standards IEC®\* 61241-10 provide instructions on how to classify the hazardous areas in relation to the chemical nature, to the physical characteristics and to the amount of substances used and based on the frequency and period of time in which an explosive mix may develop.

### Zones susceptible to gas

When the hazard is due to the presence of gas, vapours or mists of flammable substances, the European directive 1999/92/EC envisages a classification in three zones defined as follows:

<b>Zone 0</b>	Areas constantly susceptible to an explosive atmosphere, or for long periods of time. Power equipment with double insulation must be installed in this area.
<b>Zone 1</b>	Areas where an explosive atmosphere is likely to develop during normal conditions. Flameproof electric motors or motors with added protection means can be installed in this zone (for the latter, restrictions by he standards apply).
<b>Zone 2</b>	Areas rarely susceptible to an explosive atmosphere and for a short period of time. Flameproof motors or motors with added protection can be installed in this zone, as well as non-sparking motors.

**Fig. 0B** - Warning sign for areas subject to the risk of explosion - Directive 99/92/EC

### Zones susceptible to combustible dust

When the hazard is due to the presence of combustible dust, the European directive 1999/92/EC envisages a classification in three zones defined as follows:

<b>Zone 20</b>	Areas constantly susceptible to an explosive atmosphere, or for long periods of time. Power apparatus cannot be installed in this zone.
<b>Zone 21</b>	Areas where an explosive atmosphere is likely to develop during normal conditions. Electric motors certified in compliance with the ATEX®* directive with IP6x protection rating can be installed in this zone
<b>Zone 22</b>	Areas rarely susceptible to an explosive atmosphere, and only for a short period of time. Depending on the type of dust also in zone 22 it may be necessary to have IP6x construction (see 0.4.4).

**Table 0C** - Dangerous areas classified into zones

Usage area in the presence of <b>GAS</b>	Usage area in the presence of <b>COMBUSTIBLE DUSTS</b>	Hazardous level of the operational <b>ZONE</b>
Zone 0	Zone 20	Explosive atmosphere <b>ALWAYS PRESENT</b>
Zone 1	Zone 21	<b>PROBABLE</b> explosive atmosphere
Zone 2	Zone 22	Explosive atmosphere <b>UNLIKELY</b>

#### **0.4.3 APPARATUS CLASSIFICATION**

The ATEX®\* 2014/34/EU European Directive classifies equipment into three categories, with differing protection levels, related to the protection guaranteed.

**NOTE:** Equipment of higher categories can also be installed instead of those of a lower category.

**Table 0D** - Equipment categories

PROTECTION LEVEL guaranteed by the equipment Category	MINE Category	SURFACE	
		Gas Category	Combustible Dust Category
Very high	M1	1G	1D
High	M2	2G	2D
Normal	not provided for	3G	3D

#### **0.4.4 ENCLOSURE GROUPS**

The standards classify electrical equipment into two groups.

<b>Group I</b>	electric apparatus to be installed in mines or galleries susceptible to firedamp or coal dust.
<b>Group II</b>	electric apparatus to be installed in surface plants susceptible to other explosive atmospheres.

The housings for equipment to be used at the surface in the presence of gas, with protection method "db" (explosion proof), are in turn subdivided into three sub-groups depending on the flammable substances for which they are suitable: Group IIA, Group IIB, Group IIC.

A motor that belongs to a certain enclosure group is also suitable for lower enclosure groups:

A motor in group IIB is also suitable for group IIA; a motor in group IIC is also suitable for group IIA and IIB.

The housings for equipment to be used in atmospheres containing flammable dust, with protection method "t", are separated into three sub-groups depending on the type of dust:

IIIA: flammable particles

IIIB: non-conducting dust

IIIC: conducting dust

**NOTE:** for the IIIC group and also for installation in zone 22 a minimum protection level of IP6x is necessary.

#### **0.4.5 TEMPERATURE CLASSES (FOR GAS ATMOSPHERES)**

The electrical apparatus is classified into 6 classes according to the maximum surface temperatures.

The maximum surface temperature is the highest temperature which is attained in service under the conditions described in the standards, by any part of the electrical apparatus, which, could ignite the surrounding atmosphere.

For electric motors this is:

- Temperature of the outside surface of the enclosure for "db" and "p" protection modes;
- Temperature of any internal or external point for type of protection "e" or "n".

**Table 0E**

Ignition temperature of medium relative to limit temperature [°C]	Temperature class	Maximum surface temperature of electrical equipment including 40°C ambient temperature	
		[°C]	[°F]
over 450	T1	450	842
from 300 to 450	T2	300	572
from 200 to 300	T3	200	392
from 135 to 200	T4	135	275
from 100 to 135	T5	100	212
from 85 to 100	T6	85	185

#### 0.4.6 COMBUSTION TEMPERATURES OF GASES, VAPOURS AND GROUPS

Combustible gases and vapours are divided into classes according to their ignition temperature and into groups according to their explosive capacity.

Markings on motors and other electrical equipment with the symbols used to indicate the protection mode, the enclosure group, and the temperature class, indicate the zone in which such equipment can be installed.

The indications contained in table 0F are shown only as an example. Classification of the substances is not the responsibility of the supplier of the equipment. Responsibility for the choice of equipment lies with the user.

**Table 0F -** Classification of the more common combustible gases and vapours according to temperature class and group

Group	Temperature Classes					
	T1	T2	T3	T4	T5	T6
I	Methane (firedamp)					
IIA	Acetic acid Acetone Ammonia Benzole Benzene Butanone Carbon monoxide Ethane Ethyl acetate Ethyl Chloride Methane Methanol Methyl acetate Methyl alcohol Methyl Chloride Naphthalene Propane Xylene	Acetic anhydride I amyl acetate n butane n butyl alcohol Amylic alcohol Butyl acetate Cyclohexanon Ethyl alcohol Iso butylic alcohol Liquefied gas Natural gas Propyl acetate	Cyclohexane Cyclohexanol Decane Diesel fuels Gasoline Heating oil Heptane Hexane Jet fuels Pentane Petroleum*	Acetaldehyde Ether		
IIB	Coke-oven gas Water gas (carburetted)	1,3- butadiene Ethylene Ethylbenzene Ethylene oxide	Hydrogen sulphide Isoprene Petroleum*	Ethyl ether		
IIC	Hydrogen	Acetylene				Carbon disulphide Ethyl nitrate

\*depending on composition

#### 0.4.7 TEMPERATURE FOR ATMOSPHERES WITH COMBUSTIBLE DUSTS

The flash point of the dust must be taken into account in providing protection against flammable dust, in both the cloud form and in layers.

The surface temperature of the enclosure indicated on the motor nameplate must be less than the reference ignition temperature. The reference temperature is the lowest between the two values thus calculated:

TS1 = 2/3 Tcl (Tcl = ignition temperature of the cloud of dust)
TS2 = T5mm - 75K (T5mm = ignition temperature of a 5mm layer of dust).
Tamm = lowest between TS1 and TS2.

Dust ignition temperature 	Cloud Tcl	Layer T5mm
Safety temperature	Ts1 = 2/3 Tcl	Ts2 = T5mm - 75K
Maximum surface temperature	Tamm = lowest between Ts1 and Ts2	
	Surface temperature of the motor ≤ Tamm	

**Table 0G** - Calculation of the flash points for combustible dusts

The surface temperature class is expressed as degrees Celsius, the manufacturer determines the temperature class depending on the thermal characteristics of its own product.

The temperature classes for the Rotor® product are as follows: T150°C - T135°C - T125°C - T100°C - T85°C.
--

The indications contained in table 0H are given only by way of example. Classification of the substances is not the responsibility of the supplier of the equipment. Responsibility for the choice of equipment lies with the user.

**Table 0H** - Examples of flash points for combustible dusts

	Cloud [°C]	Layer [°C]
Aluminium	590	>450
Carbon dust	380	225
Flour	490	340
Wheat dust	510	300
Methylcellulose	420	320
Phenolic resin	530	>450
Polyethylene	420	melting
PVC	700	>450
Soot	810	570
Starch	460	435
Sugar	490	460

Source SIRA Ltd

#### **0.4.7 LEVEL OF PROTECTION FOR THE EQUIPMENT (EPL, EQUIPMENT PROTECTION LEVEL)**

In accordance with standard IEC®\* EN 60079-0 the marking of equipment to be used in a potentially explosive atmosphere must also have the suffix EPL.

EPL is defined as the level of protection assigned to electrical equipment based on the probability of it becoming a source of ignition. The EPL also makes it possible to distinguish between the different explosive atmospheres.

The first letter makes the following distinctions:	
<b>M</b>	for mining
<b>G</b>	for gas
<b>D</b>	for dust

The second letter gives information on the probability of becoming a source of ignition:		
<b>a</b>	"very high"	protection level (guarantees safety in normal operation, during foreseeable malfunctions and when subject to rare cases of malfunction);
<b>b</b>	"high"	protection level (guarantees safety in normal operation and when subject to foreseeable malfunctions);
<b>c</b>	"increased"	protection level (it is not a source of ignition during normal operation and has some additional protection measures to ensure that it remains an inactive source of ignition in events occurring regularly).

#### **0.4.8 CHOICE OF SAFETY-ELECTRIC MOTOR**

The connection between danger zones and the categories of equipment to be used is defined in Directive 1999/92/EC. The specific construction standards for the protection modes (e.g. Ex db) also define the motor category that can be obtained by applying the standards (e.g. 2G).

**Table 0I** - Choosing the protection mode for zones in which gas is present

Explosive Atmosphere	Danger Zone	Protection guaranteed by Equipment	Motor Category	Protection Mode
ALWAYS PRESENT	0	Very High	1G	IEC EN 60079-26
PROBABLE	1	High	2G	Ex db Ex db eb Ex eb
IMPROBABLE	2	Normal	3G	Ex nA or Ex ec

**Table 0L** - Choice of protection mode for areas where combustible dust is present

Explosive Atmosphere	Danger Zone	Protection guaranteed by Equipment	Motor Category	Protection Mode
ALWAYS PRESENT	20	Very High	1D	Ex ta
PROBABLE	21	High	2D	Ex tb - IP6x
IMPROBABLE	22 Conductive dusts	Normal	2D	Ex tb - IP6x
IMPROBABLE	22 Conductive dusts	Normal	3D	Ex tc - IP5x

N. B. Equipment of a higher category can be installed in place of equipment of a lower category.

## 0.5 EFFICIENCY IE1, IE2, IE3, IE4

Rotor® product is available on IE1, IE2, IE3 and IE4 version. Efficiency level is defined by the tables 0M, 0N, 0O and 0P as per IEC®\* 60034-30 norm. Motor efficiency is measured following the requirements of IEC 60034-2-1 in force.

**Table 0M** - Nominal efficiency limits (%) for 50 and 60Hz for IE1

kW	2 POLE		4 POLE		6 POLE		8 POLE	
	50Hz	60Hz	50Hz	60Hz	50Hz	60Hz	50Hz	60Hz
0.12	45.0	57.5	50.0	62.0	38.3	48.0	31.0	36.0

# Rotor® IE1, IE2, IE3, IE4 MOTORS

## 1. GENERAL INFORMATION

### 1.1 RANGE OF MOTORS

The motors presented in this catalogue respect the standards in relation to equipment and protection systems for use on safe areas or potentially explosive atmospheres, in conformity with European directive n. 2014/34/EU dated 26/02/14, known as the ATEX®\* directive.

Classification of the areas is the responsibility of the user and for the choice of motor the indications are given in Table 1A.

The ATEX directive states that two different certificates of conformity are to be issued. One is the "EC-Type examination certificate" for the homologation of the prototype and the other is for the "Production Quality Assurance Notification".

The certificates are issued by Certification Bodies, defined as Notified Bodies, to which the European Community assigns the task of assessing the conformity of products to community directives.

**The list of notified bodies can be found in the site of the European Union on the page**

<https://ec.europa.eu/growth/tools-databases/nando/index.cfm?fuseaction=notifiedbody.main>

**The certificates of the motors can be found on Internet at**

<https://www.regalrexnord.com/brands/Rotor/Dokumentation>

**IECEx®\* certificates can also be found at**

<http://www.iecex.com>

All certificates may be supplied on request.

## 1.2 COMMON MAIN CHARACTERISTICS

Available in versions IE1, IE2, IE3 and IE4.
Flameproof motors compliant with the Standards IEC®* EN 60079-0, 60079-1, 60079-7 for atmospheres where gas is present and IEC EN 60079-31 for areas where combustible dust is present.
Three phase and single phase Squirrel Cage Asynchronous Induction motors.
Totally enclosed, fan cooled, frame IP55 with Terminal box IP65.
The motors dimensions comply with IEC 60072 standard.
Power Supply 400V/50Hz. Three-phase, 1-speed motors, 2-4-6-8 poles, T4 (for sizes between 63 and 250, multi-voltage power supply 380-400-415V/50Hz and 460V/60Hz).
Class F insulation.
Terminal Box: <ul style="list-style-type: none"><li>- Available both in a flameproof, or increased safety version</li><li>- Standard position- top, opposite feet</li><li>- Rotate by 90° in 4 positions</li></ul>
Motor frame and terminal box enclosure separated to avoid the transmission of explosions.
Winding cables connected to the terminal board by means of terminal blocks or by a flameproof sealing device.
Internal and external mechanical components painted with epoxy polyester powders. <ul style="list-style-type: none"><li>- Stainless steel nameplate</li><li>- Anti-corrosion screws</li></ul>
Highly resistant to impact: <ul style="list-style-type: none"><li>- Cast iron made frame, terminal box and endshields</li><li>- Fan cover in sheet steel</li></ul>
Low friction dust seals.
The conformity certificates also cover alternatives, such as: <ul style="list-style-type: none"><li>- Altitude over 1000m</li><li>- Modification of the rated voltage and rated frequency</li><li>- Power supply from an inverter</li><li>- Motor protection through temperature detectors</li><li>- Duty S1 to S9</li></ul>

### 1.2.1 SPECIAL CHARACTERISTICS FOR MOTORS FOR MINING APPLICATIONS

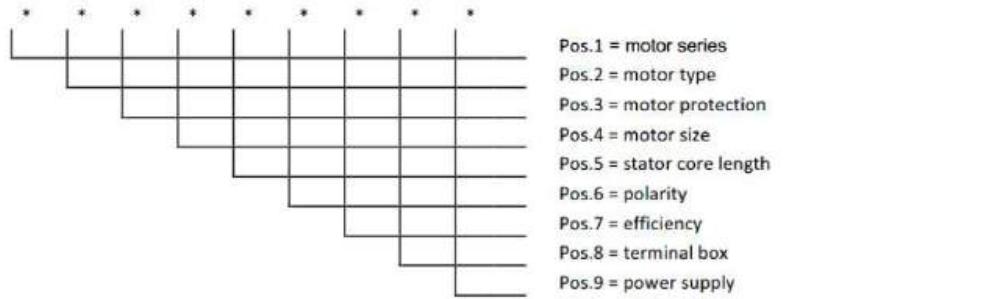

The motors in the ATEX®* Advanced Series (IE3, IE4) for mines come under group I Category M2. They are intended for use below ground and in surface areas of mines where firedamp or combustible powder can be found. This equipment is meant to be de-energised in an explosive atmosphere.
Mounting options B3, B5, B35, B14, B34.
High protection against corrosion: <ul style="list-style-type: none"><li>- Inside and outside surfaces poly-ester powder painting (minimum thickness 150 µm)</li><li>- Stainless steel nameplate</li><li>- Anticorrosion plated fasteners</li></ul>
Highly resistant to impact: special fan cover in sheet steel with rear grid protection.
The conformity certificates also cover alternatives, such as: <ul style="list-style-type: none"><li>- Modification of the rated voltage and rated frequency</li><li>- Power supply from an inverter</li><li>- Motor protection through temperature detectors</li><li>- Duty S1 to S9</li></ul>

## 1.3 MAIN OPTIONS

<b>Electrical variants</b>
Non-standard voltages and frequencies (maximum voltage 1000V).
Motors for tropical climates.
Motors for low temperatures up to -50°C Basic Series (IE1, IE2), up to -60°C Advanced Series (IE3, IE4)
Temperature rise below Class B.
Motors insulated to Class H.
Motors with bimetallic detector, thermistor PTC or thermistor PT100.
Motors with anti-condensation heaters.
Motors with special electrical design.
Single-phase motors with capacitor fitted in a large-size terminal box (Ex db).
<b>Mechanical variants</b>
Special flanges and shafts.
Double ended shafts.
Cable gland fitted to terminal box.
Terminal box with special cable entries.
Motors protection IP56 - IP65 - IP66.
Motors with condensation drain valves.
Motors with special bearings (uni-directional, with sensors, with rollers, insulated, oversized, thrust bearings).
Vibration level Grade A or B, according to IEC®* 60034-14.
Motors with a rain cap or sun shield, water-shedding disc.
Side terminal box frame size 180 to 355 (from frame 160 for Advanced Series IE3, IE4).
Separate terminal box for auxiliary terminals.
Low noise emission version.
High protection against corrosion for tropical climates or applications in marine environments: - External mechanical components finished with epoxy paint; - Protection of the internal parts (winding and rotor) with protective paint; - Stainless steel screws.
<b>Accessories</b>
Motors suitable for frequency inverter drive.
Motors with encoder.
Motors with forced ventilation (from frame size 90).
<b>Certificates</b>
Motors according to ATEX, IECEx®*.

## 2. DESIGN FEATURES

### 2.1 INSTALLATION AND APPLICATION

#### Standard installation

The motors can be installed outdoors and in dusty, moist and chemically aggressive environments (industrial climate) at ambient temperatures from -20°C to 40°C.

#### Mechanical protection (IP); Table 2A

The mechanical protection systems for electric motors are classified with the IP code followed by two numbers and, in some applications, by a letter.

<b>IP</b>	(International Protection)	this indicates the level of protection against accidental contacts of foreign bodies and against water.
<b>0 - 6</b>	(1st digit)	this indicates the level of protection against accidental contacts of foreign bodies.
<b>0 - 8</b>	(2nd digit)	this indicates the level of protection against water.

#### On-Deck Installation

Motors meant for installation on board ships and offshore areas are designed to comply with the specifications of the relevant classification authorities (see 1.3 Main options - Certificates).

#### Gear mounting, Oil-protected Flange

In some applications, it is necessary that the flange and the drive shaft are completely sealed against oil. This need must be specified during the order phase.

#### Fixed bearings

Some applications need to have a "zero axial play". This need must be specified during the order phase.

#### Cooling

Motors are air-cooled by means of external surface ventilation (IC 411). Standard motors have radial flow fan allowing fully reversible rotation. Reference standards are: IEC®\* 60034-6. From frame size 100 to 315 motors may be supplied with forced ventilation.

**Table 2A** - Mechanical protection to IEC 60034-5

<b>Protection against accidental contact and the penetration of foreign bodies</b>	<b>International protection</b>	<b>Protection against water</b>
Complete protection against contact and approaching of voltage-carrying parts as well as against contact with rotating parts inside the housing. Protection against harmful dust deposits. The penetration of dust is not completely prevented but the dust cannot enter in such quantities as to affect operation.	<b>IP55</b> standard design	A jet of water squirting out of a nozzle towards the motor from all directions has no harmful effect.
	<b>IP56</b> special design	In case of temporary flood, e. g. heavy seas, water cannot enter into the motor in harmful quantities.
Complete protection against contact of voltage-carrying parts as well against contact with rotating parts inside the housing. Protection against the penetration of dust (dust-proof).	<b>IP65</b> special design	A jet of water squirting out of a nozzle towards the motor from all directions has no harmful effect.
Complete protection against contact of voltage-carrying parts as well against contact with rotating parts inside the housing. Protection against the penetration of dust (dust-proof).	<b>IP66</b> special design	In case of temporary flood, e. g. heavy seas, water cannot enter into the motor in harmful quantities.

## 2.2 LOW TEMPERATURE VERSION AND ANTI-CONDENSATION HEATING

### Low Temperature Version

Motors intended for use at extremely low temperatures are specially designed. Flameproof certificates are valid for temperatures as low as -50°C on Basic Series and -60°C on Advanced Series.

### Anti-condensation heating

Condensate may form inside the motor due to temperature fluctuations. To prevent this from happening, motors must be heated using strip type heaters on the end windings or low voltage power can be supplied to the winding via terminals U1 and V1. The heat output is given in table 2B. It is vital that during the motor operation the heaters are turned off. The supply voltage for the heaters is 230V ± 10% (115V ± 10% on request)

**Table 2B** - Rotor® range of motors

Frame Size	For preventing condensation							For protection at temperature below -20°C (down to -50°C)						
	With heater	Via Motor Winding						With heater	Via Motor Winding					
		Heating voltage with a rated motor voltage of							Heating voltage with a rated motor voltage of

## 2.3 MATERIALS, PAINTING AND NAMEPLATE

### 2.3.1 MATERIALS

**Table 2C** - Materials of the main components:

Frame Endshields Terminal box	Cast iron G200 (ISO 185)
Fan cover Rain cap	Steel
Fan	Non sparking thermoplastic material or aluminum. Brass for motors for mining applications and on request
Shaft	Steel C45
Rotor	Squirrel cage in pressure cast aluminum
Winding	Insulation class F or H
Bolts and screws	Galvanised steel 8.8 or A4-80 UNI EN ISO 3506-1
Cable gland (on request)	Brass, nickel plated brass or stainless steel
Brake enclosure	Cast iron
Brake terminal box	Cast iron

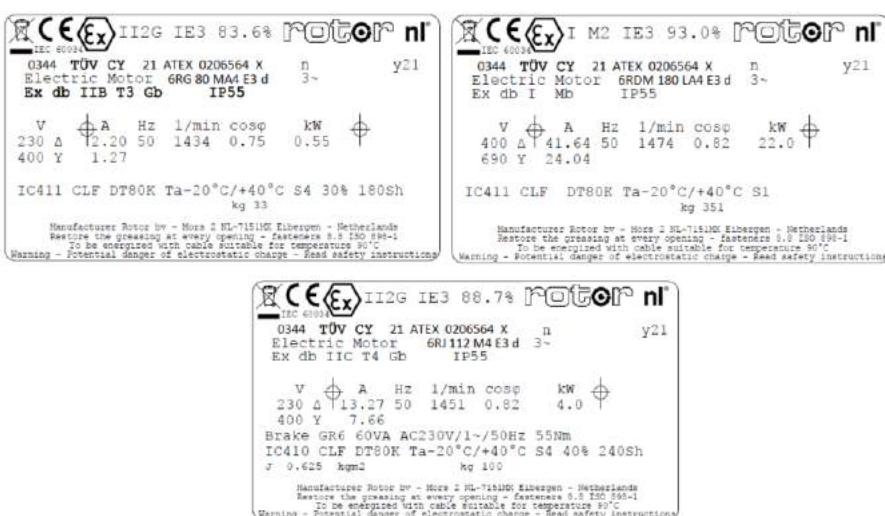

## 2.3.2 PAINTING

**Table 2D** - Materials of the main components:

Frame size	63÷250	280÷355
<b>Pretreatment</b>	All components are sandblasted, cleaned and degreased	All components are sandblasted, cleaned and degreased
<b>Painting</b>	Polymerised epoxy polyester powder, oven-baked at 200°C	Treatment with anti-corrosion primer Final coat of enamel paint
<b>Thickness</b>	Total 120 µm (different thicknesses available upon request)	Total 120 µm (different thicknesses available upon request)
<b>Colour</b>	RAL 5010 (special colours available upon request)	RAL 5010 (special colours available upon request)
<b>Mechanical strength</b>	Non-abrasive, elastic, insensitive to scratches, resistant to impact	Non-abrasive, elastic, insensitive to scratches, resistant to impact
<b>Corrosion resistance</b>	Highly resistant to water, water vapour, salt water	Highly resistant to water, water vapour, salt water
<b>Chemical resistance</b>	Good resistance in chemically aggressive environments	Good resistance in chemically aggressive environments
<b>Temperature range</b>	-60°C +130°C	-60°C +130°C

## 2.3.3 NAMEPLATE

The stainless steel nameplate is fitted on the motor frame.

**Fig. 2A** - Example of nameplates

## 2.4 SHAFT ENDS, BALANCING, VIBRATIONS, NOISE LEVELS, COUPLING AND BELT DRIVES

### Shaft ends

The shaft ends are cylindrical and comply with IEC®\* 60072 in their design and in their correspondence to frame sizes and outputs. The shaft ends of all motors are equipped with a tapped hole to assist in the fitting of pulleys and couplings. The keys are always supplied along with the motors.

On request, special shaft ends or a second free shaft end can be provided. Pole-changing motors with a 2-pole speed have the same shaft ends as single-speed 2-pole motors.

### Balancing, and vibration

The motors are dynamically balanced with half keys in accordance with vibration grade "A" (N) normal balance IEC 60034-14 (and ISO 8821).

The low-vibration version "B" (R) (reduced) can be supplied where high demands are made on quiet running. Care must be taken to ensure that transmission parts (pulleys, couplings) supplied by others are dynamically balanced with half key.

## Noise level

Noise measurements are performed to IEC®\* 60034-9.

In the performance data, the sound pressure levels "L<sub>p</sub>" are given in dB (A) for the individual frame sizes.

They apply for no load at 50Hz. The tolerance is + 3 dB (A).

At 60Hz the values of sound pressure increase approximately by 3 dB (A).

## Coupling drive

When aligning a motor to be coupled directly to the machine, care must be taken that the rollers and balls of the bearings do not jam. Elastic couplings are permissible with all motors.

To ensure vibration-free running and to avoid any inadmissible stress on the bearings, the machine to be coupled must still be exactly aligned in the case of elastic coupling. Maximum accuracy must be applied to the coupling of 2-pole motors.

## Belt drive

Slide rails are used for motors for easy tensioning and readjustment at the belts. Permissible forces have to be taken into consideration (See Table 2I). Pulleys and couplings must only be fitted and removed by means of specific tools.

**Table 2E** - Vibration limits according to IEC 60034-14

Balancing rate	Limit values of the speed of vibration/oscillation for frame sizes:			
	63÷132 [mm/s]	160÷280 [mm/s]	315 [mm/s]	355 [mm/s]
A	1.6	2.2	2.8	2.8
B	0.7	1.1	1.8	1.8

Terms of measure: Free standing

## 2.5 BRAKE MOTORS

### Construction method

Motors in these two series are built with an integrated brake and are considered as an integral unit, consequently, a single ATEX®\* certificate is provided for both motor and brake.

The brake is enclosed in a special enclosure built with a Ex db IIB or IIC protection type and IP65 mechanical protection. The temperature class and maximum surface temperature are those of the motor. The electro-magnet winding is encapsulated in resin which isolates it and provides mechanical protection.

### Basic Series (IE1, IE2)

Motors with frame size 63 to 160 are normally fitted with a three-phase magneto with a power supply of 110V to 690V. Alternatively, upon request, a magneto can be supplied with a direct current power supply using a rectifier, with a single-phase power supply of 48V to 440V. If you have a direct current power supply line, the magneto can be powered directly using that line (from 24V to 230V).

### Advanced Series (IE3, IE4)

Motors are fitted with a direct current power supply using a rectifier with a single-phase power supply from 48V to 500V a.c. single phase. If you have a direct current supply line, the electromagnet can be powered directly using direct voltage supply from 48V to 500V. Other voltage can be made on purpose.

Motors with an axle height of 180 to 315 use a "K10" type brake, which is only available with the magneto powered using direct current. This type of brake is always supplied with a direct current power supply using a rectifier, with a single-phase power supply of 48V to 440V.

Basic Series (IE1, IE2)
Frame size 63-315
Three phase brake included as standard up to frame size 160, DC brake or DC brake with AC 1Ph rectifier from frame size 180 up to frame size 315 / DC brake or DC brake with AC 1Ph rectifier as option up to frame size 160
One terminal box for motor and brake power supply up to frame size 160 included, separate brake terminal box from frame size 180 and above.
Single brake disc included as standard / double brake disc available on request
Max brake speed 3600 RPM up to frame size 160 / max brake speed 1800 RPM from frame size 180 and above
IC410-IC411-IC416 versions available up to frame size 160 included, IC410-IC416 versions available from frame size 180 and above
2 bearings, double shaft extension available on request only for manual rotation up to frame size 160 included
Manual release available as option on all frame sizes (single brake disc version)
Micro switch available as option from frame size 132 and above
Standard AC 1Ph rectifier available on request

\*The following trademarks or tradenames are not owned or controlled by Regal Rexnord Corporation:  
ATEX is a trademark of European Union; IEC is a trademark of International Electrotechnical Commission.

<b>Advanced Series (IE3, IE4)</b>
Frame size 80-250
DC brake or DC brake with AC 1Ph rectifier up to frame size 250
One terminal box for motor and brake power supply up to frame size 132 included, separate brake terminal box from frame size 160 and above
Single brake disc version with wide brake torque regulation
Max brake speed 3600 RPM up to frame size 250
IC410-IC411-IC416 versions available up to frame size 250
3 bearings, double shaft extension available on request for manual release or for normal service duty
Manual release available as option on all frame sizes (single brake disc version)
Micro switch available as option from frame size 90 and above
Fast acting AC 1Ph rectifier included as standard

## Operation

The brake is made up of:

- Magnet
- Counter-magnet (or mobil armature) supported by three small columns where it can slide
- Braking disk
- Toothed hub secured to the motor shaft

When the coil is powered, the magnet attracts the mobil armature which thus releases the braking disk so the motor can rotate freely. By removing voltage to the magnet, the springs push the mobil armature against the braking disk, which, by creating friction against the motor shield, locks the shaft rotation.

In rest conditions, when the brake is notpowered, the motor remains locked.

## Braking torque calibration

The motor is supplied with a ready-to-use calibrated brake.

Special calibration available on request. This is carried out during assembly before final testing.

Table 2F shows the standard braking torques.

## Manual release

**6RJ, 6RH** series flampproof motors with brake can be supplied on request with hand release lever for the brake.

Pressure is applied on the release mechanism which moves the mobile armature, freeing the motor's shaft. When releasing pressure on the mechanism the brake automatically returns to the fail safe position.

**Table 2.1F - Standard technical data of the integrated brake for Basic Series (IE1, IE2)**

## 2.6 BEARING SYSTEM

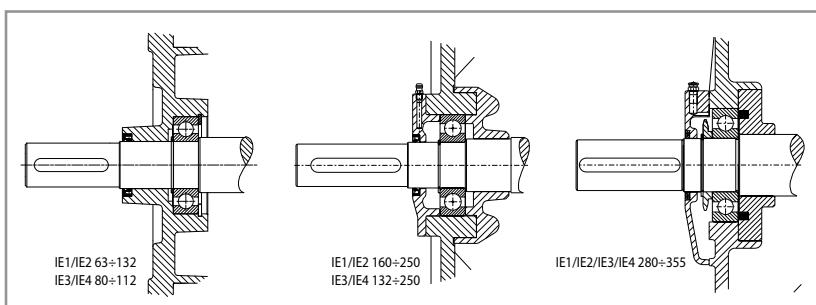

Standard motors are equipped with radial deep groove ball bearings (ZZ pre-greased series) or open bearings complete with grease nipples. Where requested roller, or other special bearings can be fitted.

### Lubrication

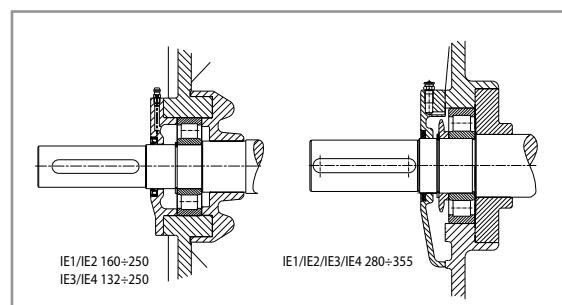

The ZZ series bearings are lubricated for life and require no further lubrication. Open bearings are supplied with grease nipples and are to be lubricated according to the indications given in the table 2G - 2H.

### Bearing Seal

In order to prevent dust and water penetration, a seal ring is fitted to the endshield on the driving and non-driving ends. These seal rings are highly resistant to vibrations, thermally stable, and resistant to mineral oils and diluted acids. Seals for media not listed above are available on request.

## 2.7 PERMISSIBLE RADIAL LOADS ON THE SHAFT WITH STANDARD BEARINGS

Table 2I shows the values of radial load calculated considering:

- Frequency 50Hz;
- Temperature not exceeding 90°C;
- 20,000 hours of life for 2-pole motors;
- 40,000 hours of life for 4, 6, 8-pole motors.

For operation at 60Hz the values have to be reduced by 6% in order to achieve the same useful life. For double speed motors, consider always the higher speed.

The distance of the point of action of force  $F_R$  from the shoulder of the shaft must not exceed the length of the shaft end.

$F_R$  = Maximum radial load (e. g. belt load + weight of belt pulley)

$$F = \text{Belt load [N]} = \frac{2 \cdot K \cdot M}{D}$$

$$M = \text{Torque [Nm]} = \frac{9550 \cdot P}{n}$$

P = Rated motor output [kW]

n = Rated motor speed [1/min]

D = Belt pulley diameter [m]

K = Prestress factor governed by belt type: it is assumed approximately as follows

K = 3 For normal flat belts without tensioning pulley

K = 2 For normal flat belts with tensioning pulley

K = 2.2 For V-belts or special flat belts

Table 2I

For special applications and for 355 motors, verification of admissible loads will be calculated during the offer phase.

## 2.8 PERMISSIBLE AXIAL LOAD ON THE SHAFT WITH STANDARD BEARINGS

If the shaft end is loaded at  $X^2$  with the permissible radial load  $F_A$ , an additional axial load is allowed (table 2L).

If the permissible radial load is not fully utilized, higher loads are possible in axial direction (Values on request).

## 2.9 TERMINAL BOX DESIGN

The standard design has four basic versions:

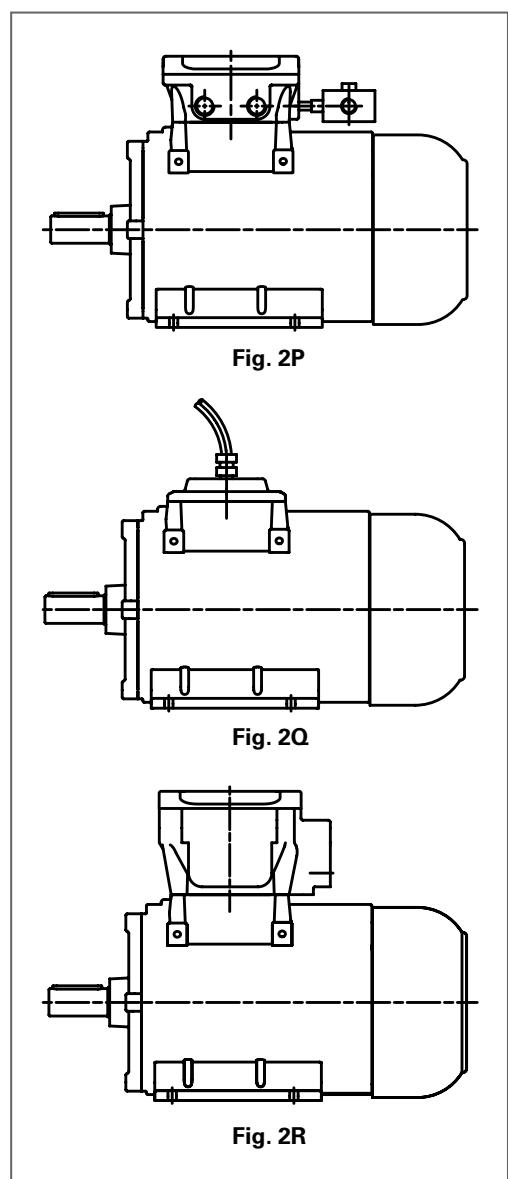

- Ex db IIB
- Ex db IIC
- Ex eb IIB
- Ex eb IIC

On request we can supply:

- Additional terminal box for auxiliary terminals (Fig. 2P)
- Motors without terminal box and with leads (Fig. 2Q)
- Bigger terminal box with capacitor for single phase motors (Fig. 2R).

**Fig. 2O** - Standard motor version terminal box Ex db, group IIB/ IIC(front)

Series 6RJ, 6RH (63÷112) motors

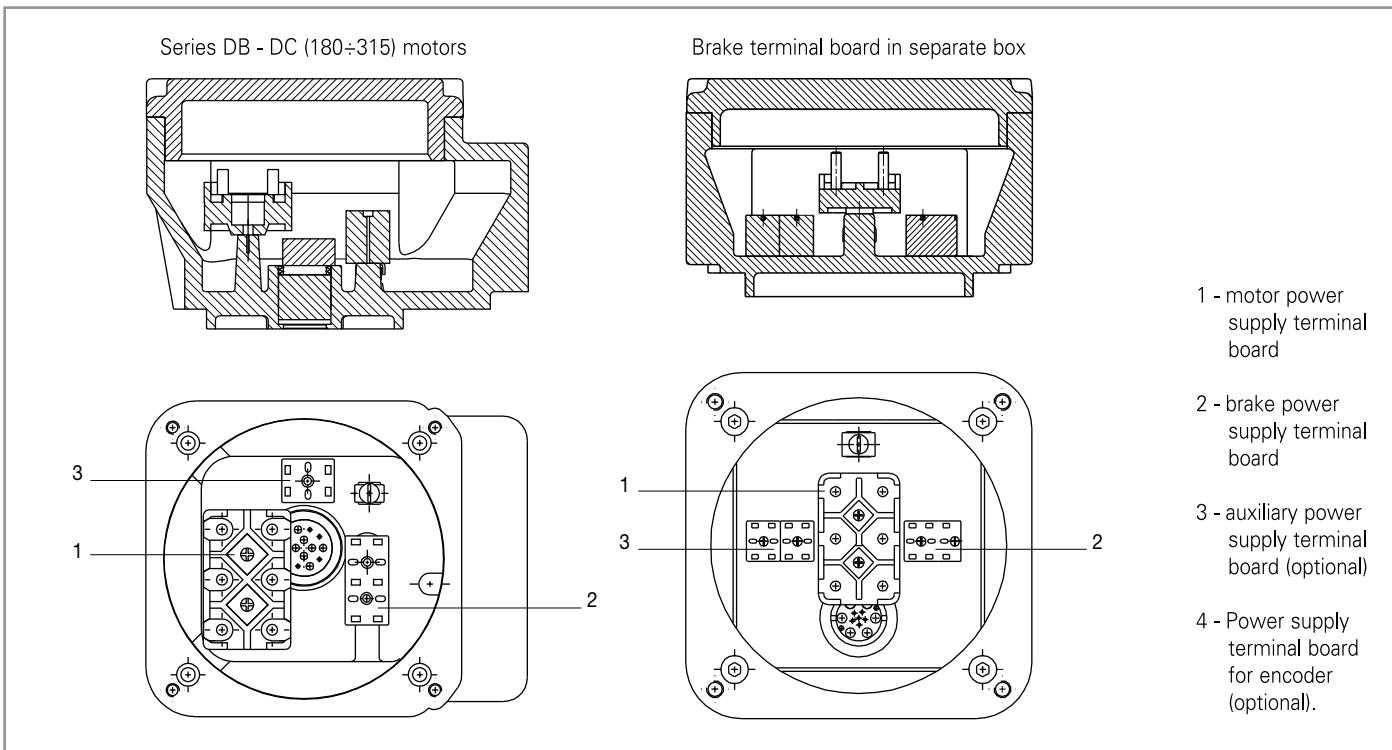

Series 6RJ, 6RH (132÷160) motors

- 1 - motor power supply terminal board
- 2 - brake power supply terminal board
- 3 - auxiliary power supply terminal board (optional)

**Fig. 2S** - Motor with brake terminal box

**Fig. 2T** - Motor with brake terminal box

## 2.10 POSITION OF TERMINAL BOX AND TERMINALS

The terminal box is usually located on top and can be turned through  $4 \times 90^\circ$  (Fig. 2U). For a horizontal mounted motor, the cable entry is normally located on the right side (looking at the driving-end).

Cable entry:

- Standard position: 1
- Special positions upon request: 2, 3, 4.

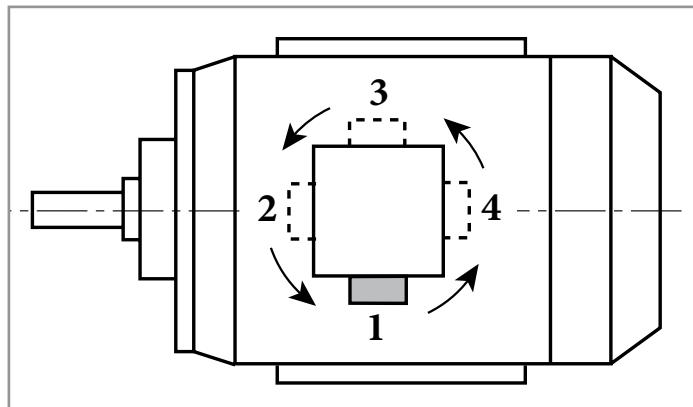

### Terminals and earthing terminal

There are a maximum number of 6 power terminals in the terminal box. The type of monitoring device depends on the number of possible additional terminals in the main terminal box.

PTC thermistors can be connected to two additional terminals. Two terminals are also necessary for connecting the anticondensation heater.

For PT 100 (RTD) thermistors, 3 or 4 terminals are necessary depending on the type chosen.

An earthing terminal is located in the terminal box and another earthing terminal is located on motor frame.

**Fig. 2U** - Positioning of the cable entry, plan view

## 2.11 CABLE-ENTRIES

As standard, the motors are delivered with one or two threaded cable entries for flameproof packing glands.

Ex db eb motors can be also provided with Ex eb packing glands.

Motors fitted with thermodetectors or heaters are always provided with additional cable entry.

Frame size	Mains connection cable entries

# 3. ELECTRICAL DESIGN

## 3.1 STANDARD OPERATING CONDITIONS

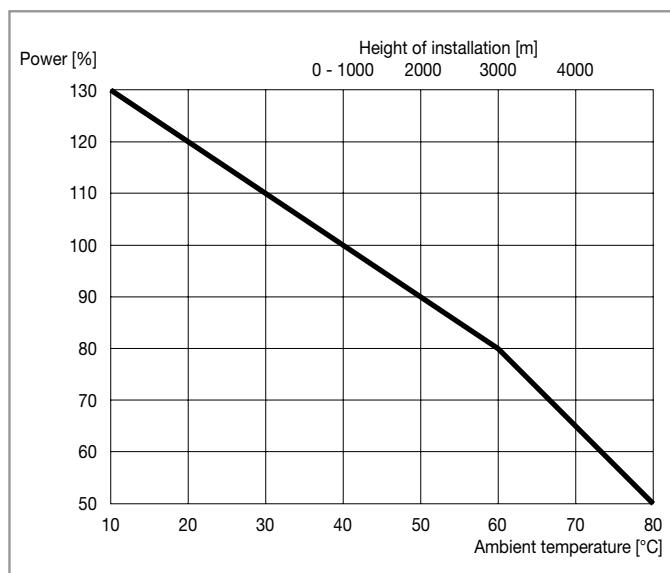

### Output

The rated outputs and operating characteristics given in the performance data according to IEC®\* 60034-1 refer to:

- Continuous duty (S1)
- Frequency of 50Hz
- Voltage 400V (230V for single phase)
- Standard ambient temperature of -20/+40°C
- Maximum height of installation of 1000m above sea level

Advanced Series (IE3, IE4) motors can operate at rated output up to 60°C without derating.

Motors can also be operated in ambient temperatures up to 80°C and at altitudes up to 4000m above sea level. In these cases, the rated output given in the tables must be reduced in accordance with table 3A or a larger motor has to be chosen.

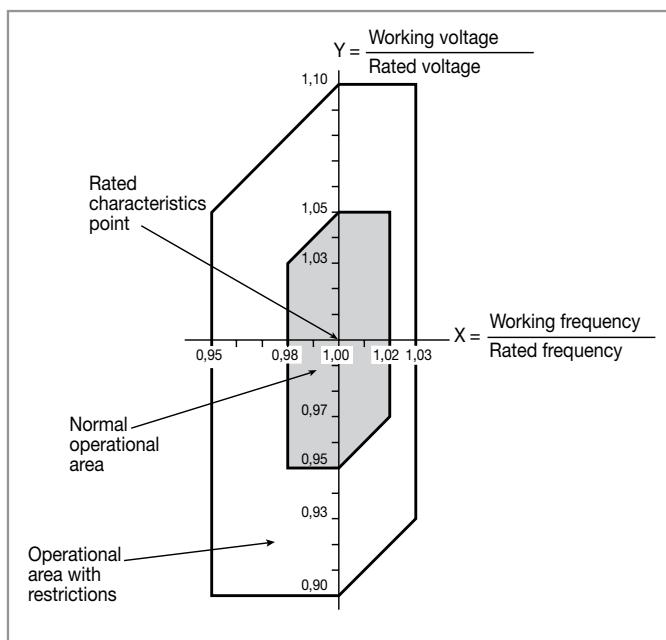

**Table 3A** - Power variation of standard motors in case of coolant temperature different from 40°C or height of installation over 1000m above sea-level

The rated data does not need to be changed, if at altitudes in excess of 1000m above sea level, the ambient temperature is reduced according to the following table:

Altitude of installation [m]	Maximum ambient temperature[°C]
0 to 1000	40
1000 to 2000	30
2000 to 3000	19
3000 to 4000	9

### Voltage and Frequency

The motors as standard are built to run at the voltage and frequency with the tolerances indicated in figure 3A.

**Figure 3A**

The motors can run with the variations envisaged in normal operational areas at a voltage of  $\pm 5\%$  and frequency of  $\pm 2\%$ .

Furthermore, the motors can be used in the operational area with restrictions (variations in voltage of  $\pm 10\%$  and frequency of  $\pm 3\%$ ) as long as the indications given by norm 60034-1 are complied with.

### Torque

The motors are fitted with squirrel-cage rotors suitable for direct-on-line starting. The resulting starting and maximum torques, expressed as a multiple of the rated torques are given in the performance data.

A deviation in the voltage from the rated value changes the torques as an approximate function of the square of the voltages.

Normally two-speed motors have a nominal torque that is roughly the same for both speeds.

A version is also available with quadratic torque, for centrifugal machines (fans, pumps). In this case, the torque at the lower speed is roughly half that available at the higher speed.

### Rated current

In the performance data the rated currents are only indicated for a rated voltage of 400V.

For other voltages the rated currents are inversely proportional to the voltages:

$$\frac{U}{U'} = \frac{I'}{I}$$

This results in:

$$I' = \frac{U \cdot I}{U'}$$

\*IEC is a trademark of International Electrotechnical Commission and is not owned or controlled by Regal Rexnord Corporation.

## Speed

The rated speeds shown in the performance data are valid for 50Hz and the rated speed equals synchronous speed less slip. The following speeds result from the number of poles and the mains frequencies of 50 and 60Hz:

## Direction of rotation

Pole number	No-load speed at	
	50Hz [1/min]	60Hz [1/min]
2	3000	3600
4	1500	1800
6	1000	1200
8	750	900
10	600	720
12	500	600
16	375	450

The motors can be operated in both directions of rotation. If the phases are connected in the sequence L1, L2, L3 to the terminals U1, V1, W1, the motor turns clockwise. The direction of rotation can be reversed by interchanging any two phases.

**NOTE:** Regarding electro-magnetic compatibility, Low voltage induction motors, if installed correctly and connected to the power supply, respect all immunity and emission limits as set out in the regulations relating to electro-magnetic compatibility (EMC "Generic Standard" for industrial environments).

In the case of supply by means of electronic impulse devices (inverters, soft starters etc.), all verifications and any modifications, necessary to ensure that emission and immunity limits, as stated within the regulations, are respected, are the responsibility of the installer.

## Tolerances

According to IEC®\* 60034-1 the electrical data stated in the tables are subject to the following tolerances:

Efficiency	
Pn ≤ 50 kW:	- 0.15 (1-η)
Pn > 50 kW:	- 0.10 (1η)
Power factor:	$\frac{-1 - \cos \phi}{6}$
(minimum 0.02 - maximum 0.07)	
Slip at rated load operating temperature:	± 20% of rated slip
Locked rotor torque (starting torque):	- 15% + 25%
Maximum torque:	- 10%.
Current with locked rotor:	20% (no lower limit).

## 3.2 EFFICIENCY AND POWER FACTOR AT PARTIAL LOAD

The efficiency and power factor values shown in the performance data refer to rated output at 50Hz.

## 3.3 INSULATION AND TEMPERATURE RISE

### Insulation

The components of the insulation system were selected so as to ensure good protection against chemically aggressive gases, vapours, dust, oil and air humidity. All materials used for insulating the winding and winding ends correspond to insulating classes F or H according to IEC 60085:

- Enamel-insulated copper wires with temperature index 200 (class H);
- Insulating sheet on polyester base (class F);
- Impregnation with fenolic resins modified with polyether resins (class H);

### Temperature rise

Standard single-speed motors in continuous service (excluding 315M) have temperature rises that are within the limits for class B. Motors with higher output and pole-changing motors normally have temperature rise within class F limit.

Insulation class	Limit temperature [°C]
B	130
F	155
H	180

**Table 3B** - Limit temperature for insulating material according IEC 60085

Insulation class	Max temperature rise [K]
B	80
F	105
H	125

**Table 3C** - Temperature rise limit for rotating machines according IEC 60034-1

According to Normative IEC 60034-1, the values shown in the table above may be up to 10°C higher, with a feeding current variance of ± 5%.

## 3.4 DUTY TYPES

In compliance with IEC®\* 60034-1 the following duty-types are distinguished:

<b>Duty-type S1</b>	continuous running duty. Constant load operation.
<b>Duty-type S2</b>	Short-time duty.  Operating times of 10, 30, 60, and 90 minutes are recommended.
	After each operating period the motor remains de-energized until the winding has cooled down to the ambient temperature.

Duty-type where start-ups DO NOT INFLUENCE winding over-heating:

<b>Duty-type S3</b>	intermittent periodic duty.  Where starting does not influence the temperature. Duty cycle 10 minutes unless otherwise agreed upon.
	For the cyclic duration factor the values 15, 25, 40, and 60% are recommended.
<b>Duty-type S6</b>	continuous operation periodic duty.  Duty cycle 10 minutes unless otherwise agreed upon.
	For the cyclic duration factor the value 15, 25, 40, and 60% are recommended.

Duty-types where starting and braking have a corresponding INFLUENCE on the temperature rise of the winding:

<b>Duty-type S4</b>	intermittent periodic duty with starting. Intermittent periodical operation with identical cycles.
---------------------	---

For S4 duty-type the following details must be given after this code:

- Intermittence ratio;
- The number of starts per hour;
- Moment of inertia of the motor;
- Moment of inertia of the load.

<b>Duty-type S9</b>	duty with non-periodical load and speed variations. Typical operation for motors powered by frequency converters. Constant load operation. Rotor® certification cover also duty-types S5, S7, S8.
---------------------	---

Most of the real duty-type conditions represent a combination of duty-types as mentioned under 1. and 2. In order to exactly determine a suitable motor, details of all the operating conditions are required.

N.B.: The output ratings stated in the "Performance data" (Chapter 4.) apply to duty-type S1.

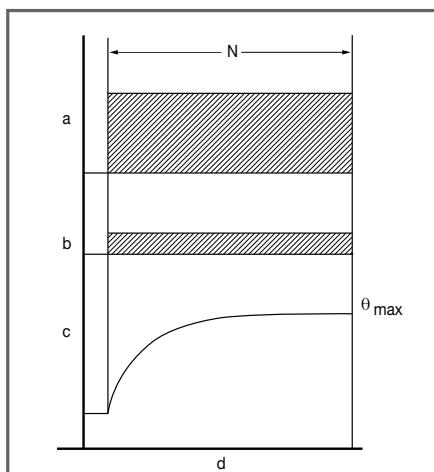

Fig. 3B - Duty type S1

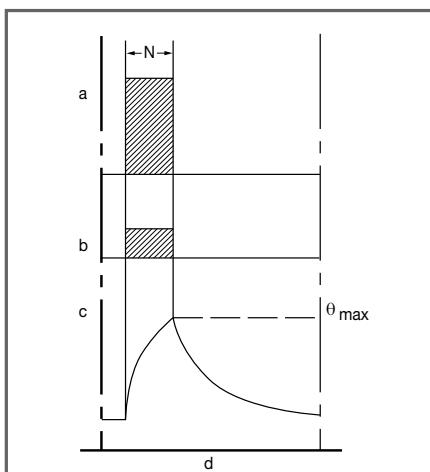

Fig. 3C - Duty type S2

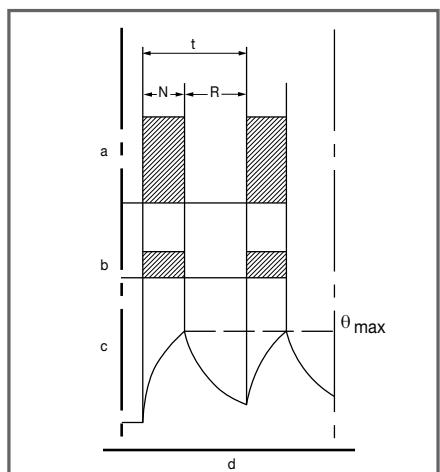

Fig. 3D - Duty type S3

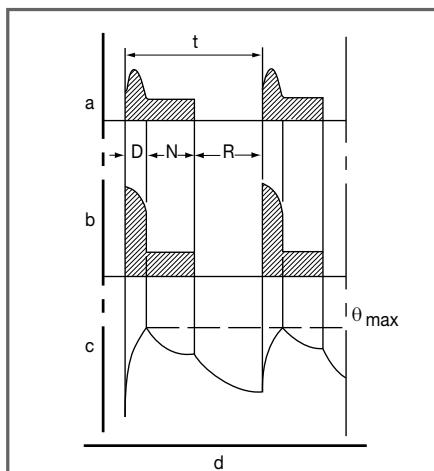

Fig. 3E - Duty type S4

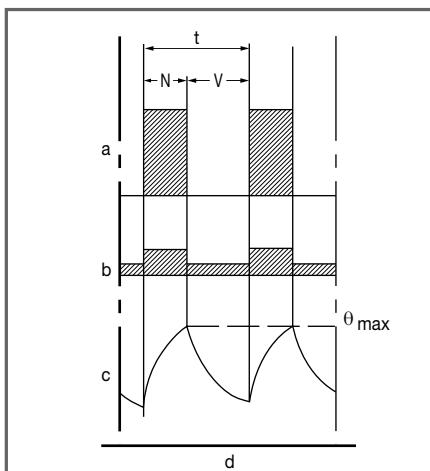

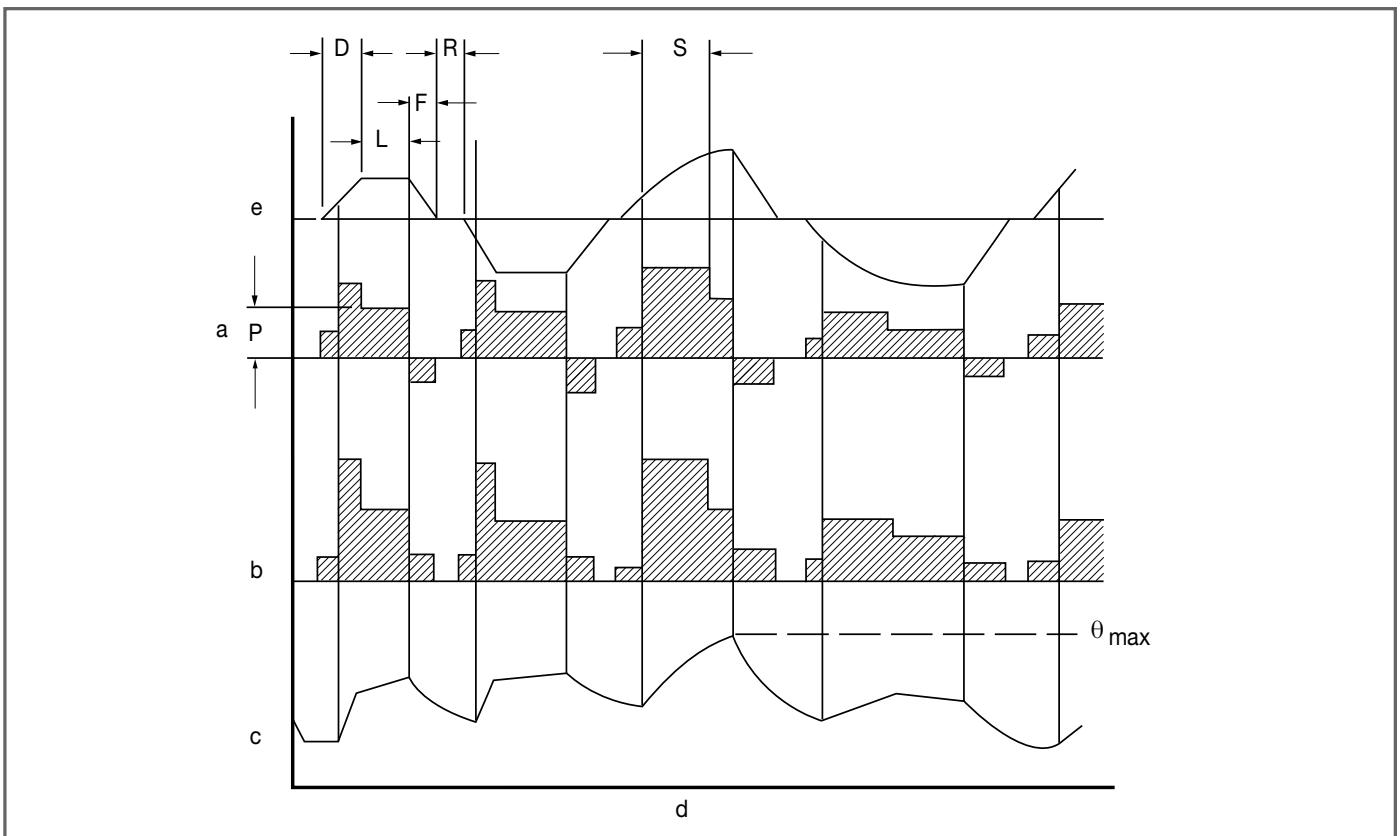

Fig. 3G - Duty type S6

**Fig. 3L** - Duty type S9

**Table 3D - Symbology**

a	Load
b	Electrical losses
c	Temperature
d	Time
e	Speed
t	Cycle length
D	Start-up or acceleration time
F, F <sub>1</sub> , F <sub>2</sub>	Electrical braking time
N, N <sub>1</sub> , N <sub>2</sub> , N <sub>3</sub>	Constant load operating time
L	Variable load operating time
V	No-load operating time
R	Rest time
S	Overload operating time
P	Full load
$\theta_{\max}$	Maximum temperature reached during cycle

## 3.5 CONNECTING DIAGRAMS

### 3.5.1 THREE-PHASE MOTORS

Single-speed motors are normally pre-arranged to be connected in star or delta method.

#### Star connection

Connecting together the W2, U2, V2 terminals (star point) and connecting to the mains the U1, V1, W1 terminals a star connection is obtained. The phase current  $I_{ph}$  and the phase voltage  $U_{ph}$  are the following:

$$I_{ph} = I_n$$

$$U_{ph} = U_n / \sqrt{3}$$

where  $I_n$  the line current and  $U_n$  is the line voltage.

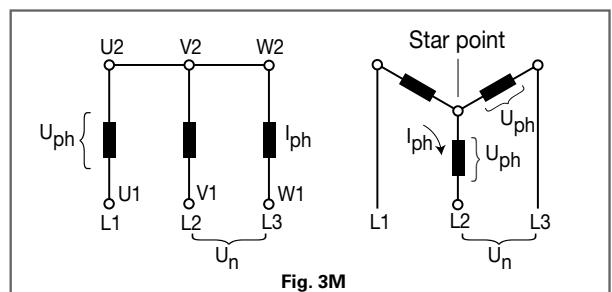

Fig. 3M

#### Delta connection

Connecting the end of each winding to the beginning of the next winding a delta connection is obtained. The phase current  $I_{ph}$  and the phase voltage  $U_{ph}$  are the following:

$$I_{ph} = I_n \sqrt{3}$$

$$U_{ph} = U_n$$

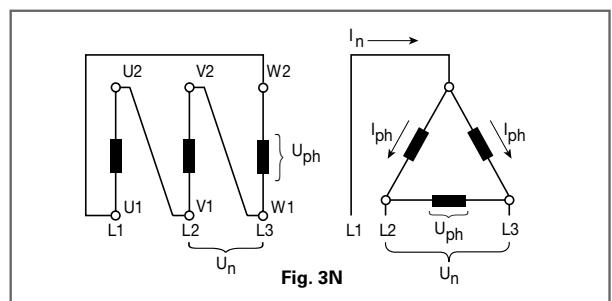

Fig. 3N

#### Star - Delta starting

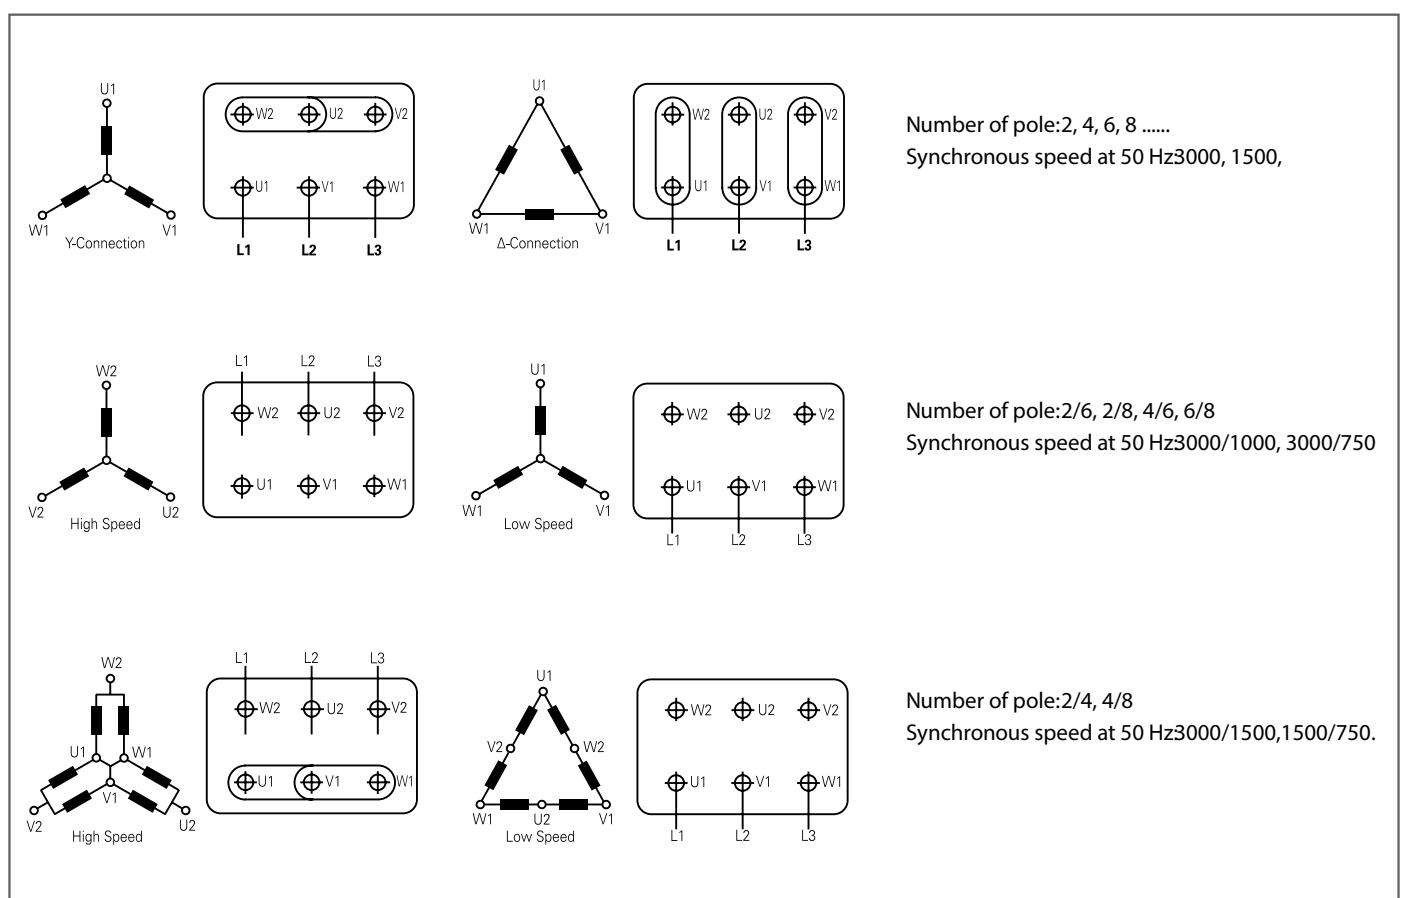

The star-delta starting is an easy way to reduce the starting current and starting torque. Motors can be started with the star-delta starting method whenever the supply voltage correspond to the rated voltage of the motors in delta connections.

#### Two speed motors

Standard two speed motors are designed for only one rated voltage and for direct starting.

When the speed ratio is 1/2 the standard motors have one winding (Dahlander connection).

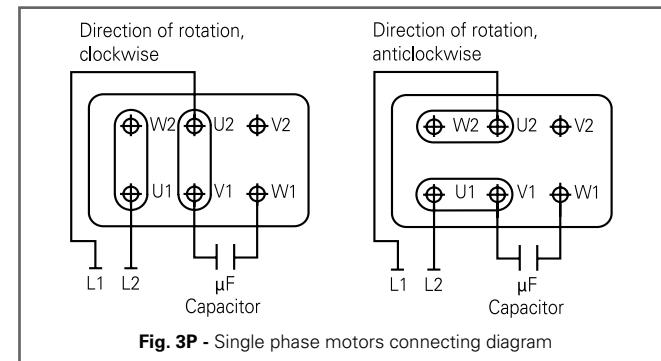

For other speed ratios the motors have two different windings.

### 3.5.2 SINGLE PHASE MOTORS

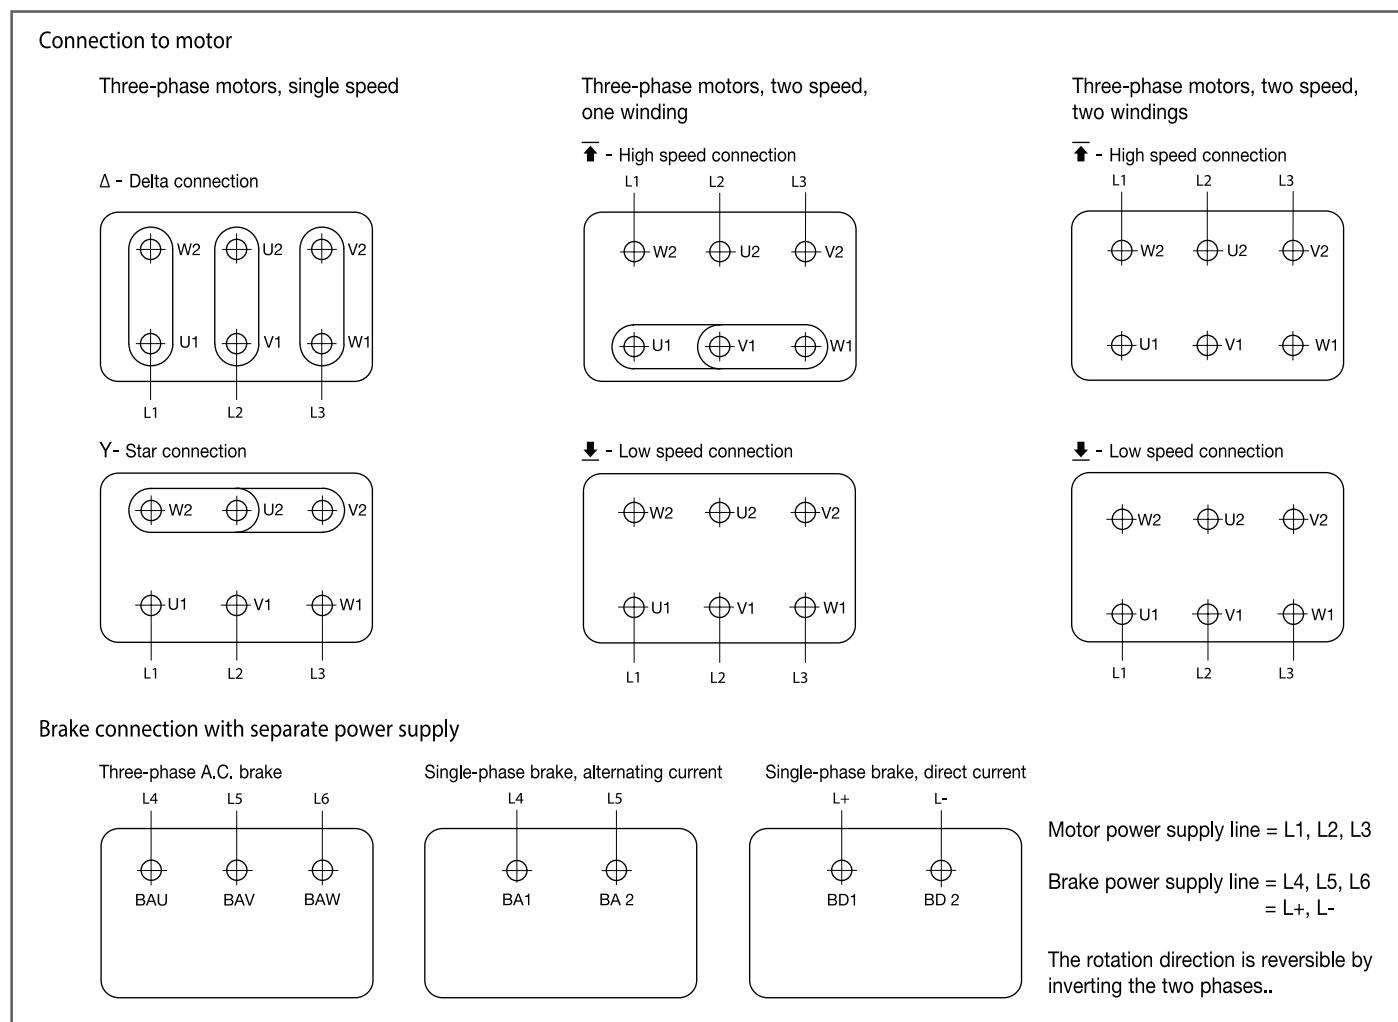

Single phase motors are designed for only one rated voltage.

They have two windings (starting and main winding) which have to be connected to the capacitor supplied with the motor. The sense of rotation can be reversed according to the connecting diagram.

### 3.6 BRAKE CONNECTION DIAGRAMS

Other connection diagrams between motor and brake are available, including a single power supply for motor and brake, or power supply on the same terminal board.

**Fig. 3Q - Motor and brake connection diagrams diagram**

### 3.7 HOURLY START-UPS ALLOWED (BRAKING: N° PER HOUR)

For motors with intermittent service, (S4) the start-ups per hour allowed depend on the service time and load characteristics, of which inertia is particularly influential. In general, as inertia increases the number of start-ups reduces.

The data given in the column for the "Braking: n° per hour" in section "4. Nominal data" in this catalogue relate to operation with loads that have an inertia 1,5 times that of the motor.

### 3.8 ADDITIONAL TERMINALS MARKING (IEC®\* 60034-8)

Motors having accessories are supplied with auxiliary terminal boards which bear the marking shown in table 3G.

Marking	No. terminals	Additional terminal for:
TP1 - TP2 (warning) TP3 - TP4 (switch off)	2 2	Thermistor PTC (*)
R1 - R2 - R3 (I sensor) R4 - R5 - R6 (II sensor) R7 - R8 - R9 (III sensor)	3 3 3	Thermistor PT 100 with 3 wires
R11 - R12 - R13 (DE) R21 - R22 - R23 (NDE)	3 3	Thermistor PT 100 on bearing
TB1 - TB2 (warning) TB3 - TB4 (switch off)	2 2	Normally closed bi-metallic switch (**)
TB8 - TB9 (switch off)	2	Normally closed brake bi-metallic switch (**)
TM1 - TM2 (warning) TM3 - TM4 (switch off)	2 2	Normally open bi-metallic switch (**)
HE1 - HE2	2	Space heaters
U1 - U2	2	Single phase forced ventilation
U - V - W	2	Three phase forced ventilation
Colours according manufacturer diagram	9	Encoder
CA1 - CA2	2	Capacitor
PE	1	Earth cable

(\*) U rated = 6V - max 30V - (\*\*) U rated = 250V

### 3.9 PROTECTION DEVICES

In order to protect the winding of a three-phase induction motor against thermal overloads, resulting in example from overloading and operation with only two phases, one of the following devices can be provided:

#### Bimetallic type device:

it consists of 2 motor protectors connected in series. The contact is normally closed; the disc opens when the windings temperature reaches limits dangerous for the insulation system. On request, normally open device are available.

#### PTC temperature sensor (thermistors):

it consists of 3 sensors connected in series embedded in stator windings. Once it reaches the operating temperature, this device quickly changes the resistance; it must be connected to a suitable releasing device (supplied only on request).

#### PT 100 (RTD) thermometric resistors (from size 132 and above).

The resistance value of this device varies according to the windings temperature. They are particularly suitable for a continuous survey of the windings temperature. For a good survey, at least two sets of PT 100 are requested; they must be connected to their proper monitoring equipment (supplied only on request).

PTC and PT 100 also offer reliable protection for operating modes other than continuous operation, e. g. short-time operation, switching operation, longtime start-up as well as for reduced cooling air flow rates and high ambient temperatures.

Motors for operation with frequency converter are always supplied with PTC thermistor temperature detectors. Above devices have their proper terminal block located inside main box. Upon request also available with separate terminal box.

### **3.10 FREQUENCY CONVERTER DRIVEN MOTORS**

Rotor® VFD motors are certified for use with all types of variable speed drives, following inverter nameplate and Safety Instructions.

Chapter 4.8 lists the electrical data in different working conditions.

When using a squirrel cage motor with a frequency converter, the following points must be taken into account in addition to the general selection criteria:

The voltage (or current) fed by the frequency converter is not purely sinusoidal. As a result it may increase the losses, vibration, and noise of the motor. Furthermore, a change in the distribution of the losses may affect the motor temperature balance.

In every case, the motor must be correctly sized according to the instructions supplied with the selected frequency converter and with our technical data.

In a frequency converter drive the actual operating speed of the motor may deviate considerably from its rated speed.

For higher speeds it must be ensured that the highest permissible speed of rotation of the motor, or the critical speed of the entire equipment, is not exceeded. In addition, bearing lubrication and any ventilation noise suppression arrangements will require special attention.

The torque values shown in this catalogue for motors with constant torque at frequencies over 60Hz can be stably supplied only if the motor has a delta connection.

For example, to stably achieve these values from a 230/400V 50Hz winding motor with a 400V 50Hz mains voltage supply, the motor must have a delta connection and, consequently, the inverter must be configured so that at 50Hz it supplies a voltage of 230V.

Vice-versa, with a star connection, the values listed can be supplied only for very short periods.

Operating periods at a speed above 3600 1/min must never exceed 10% of the entire work cycle of the motor to ensure the bearings last accordingly.

If the rated voltage is 500V or if there is a long feeding cable between the motor and the frequency converter, the insulation of the motor must be reinforced because of the occurring voltage peaks.

A correct earthing of the motor and the driven equipment is also important to avoid bearing currents and voltages.

The features of motors for use in constant torque and those for use in quadratic torque are indicated in section 4.8. Section 4.8.1 and 4.8.2 contains graphs showing loading curves for the use of variable torque motors.

The reference torque value ( $M_n$ ) is the value indicated in the tables in section 4.1.

### 4.9.1 MOTORS ENERGIZED BY INVERTER - LOAD CAPACITY CURVES

### VARIABLE TORQUE - CONSTANT FLUX

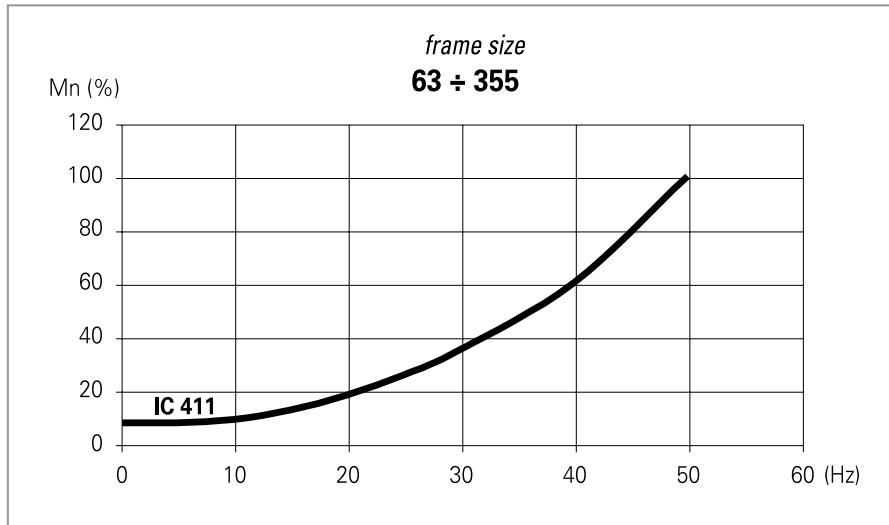

4 - 6 - 8 pole

### 4.9.1 MOTORS ENERGIZED BY INVERTER - LOAD CAPACITY CURVES

### QUADRATIC TORQUE

4 - 6 - 8 pole

**NOTE:** See page 70 - 71.

# 5. OVERALL DIMENSIONS AND MOUNTING ARRANGEMENTS

## 5.1 MOUNTING ARRANGEMENTS

The most commonly used mounting arrangements are shown in the table 5A. Other mounting arrangements are available on request.

Standard motors ordered in basic mounting arrangements (universal mounting arrangements)

IM B3, IM B5 or IM B14 can also be operated in the following different mounting positions:

- IM B3 in IM B6, IM B7, IM B8, IM V5 or IM V6,
- IM B5 in IM V1 or IM V3,
- IM B14 in IM V18 or IM V19.

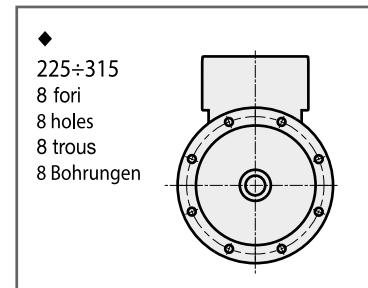

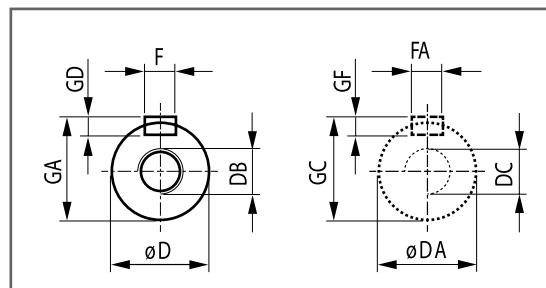

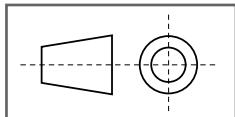

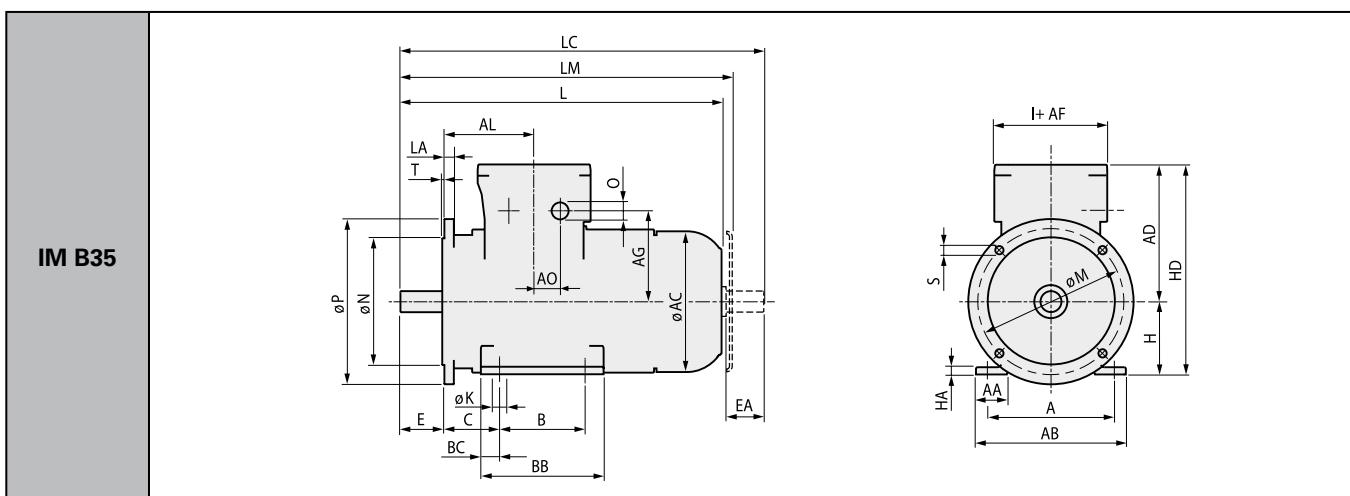

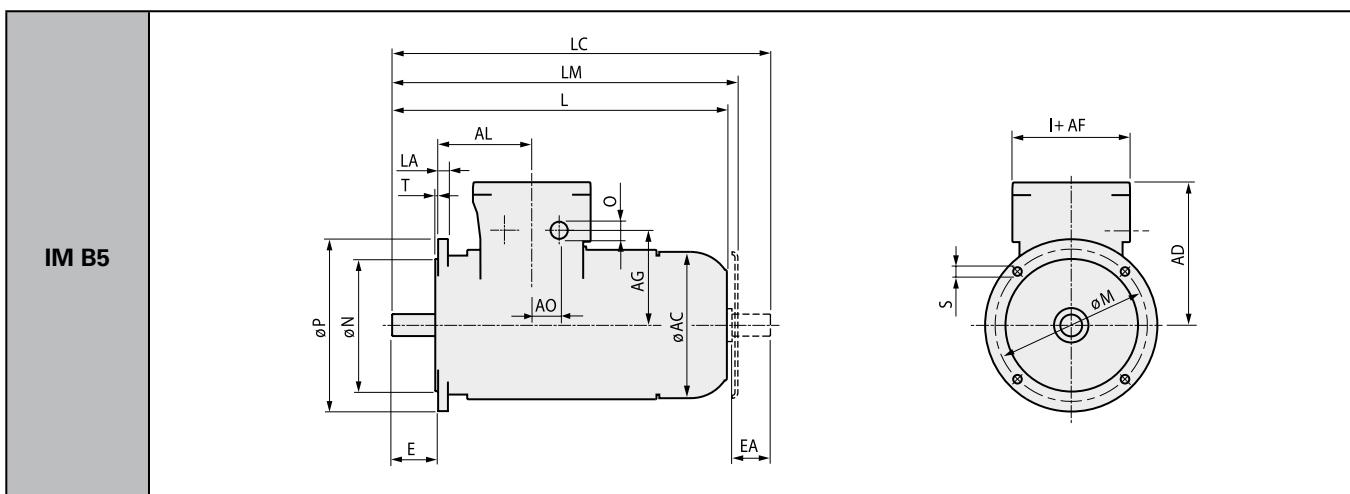

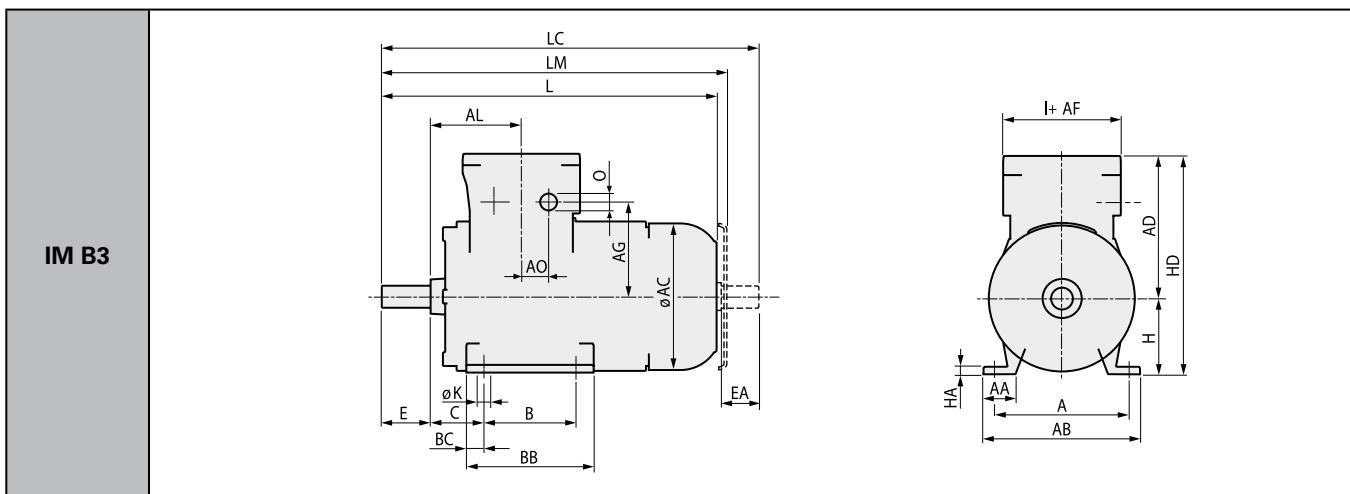

According to the safety standard for electrical machines, foreign objects must be prevented from falling into the fan cover. Motors for vertical arrangement with shaft end down are fitted with a protective hood over the fan cowl.

Tolerances allowed

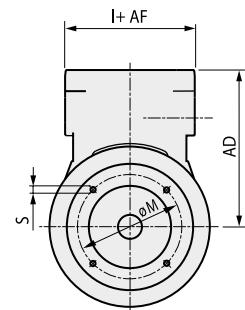

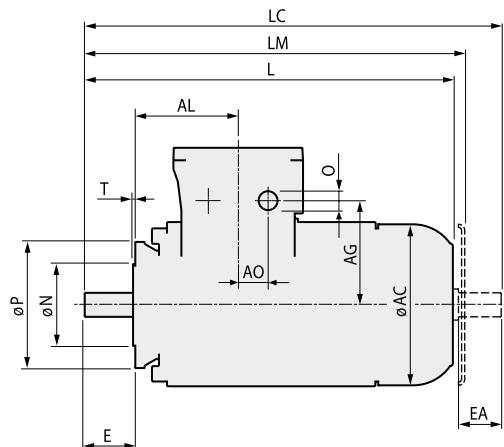

- The distance L of the motors for mining applications corresponds to the distance LM of explosion-proof motors for surfaces
- \* Rain canopy: only when vertical shaft-down mounting
- ↓ 1 in the terminal box, 1 on the frame
- 280 and 315 L fixed feet. Removable feet available on request with different dimensions

#### APPLICATION CONSIDERATIONS

The proper selection and application of motors and components, including the related area of product safety, is the responsibility of the customer. Operating and performance requirements and potential associated issues will vary appreciably depending upon the use and application of such products and components. The scope of the technical and application information included in this publication is necessarily limited. Unusual operating environments and conditions, lubrication requirements, loading supports, and other factors can materially affect the application and operating results of the products and components and the customer should carefully review its requirements. Any technical advice or review furnished by Regal Rexnord Corporation and its affiliates with respect to the use of products and components is given in good faith and without charge, and Regal Rexnord assumes no obligation or liability for the advice given, or results obtained, all such advice and review being given and accepted at customer's risk.

For a copy of our Standard Terms and Conditions of Sale, please visit <http://www.regalrexnord.com> (please see link at bottom of page to "Standard Terms and Conditions of Sale"). These terms and conditions of sale, disclaimers and limitations of liability apply to any person who may buy, acquire or use a Regal Rexnord product referred to herein, including any person who buys from a licensed distributor of these branded products.
