## PLANETARY GEAR UNITS

Modular Planetary Gearbox  
for Industrial Applications

PREMIUM

## PREMIUM PLANETARY GEAR UNITS

## PREMIUM PLANETARY GEAR UNITS

The Premium Planetary Gear Units are reliable drive components for the use of different industrial core sector :

- Sugar Mills
- Conveyor plants
- Fertilizer plants
- Coal & lignite mines
- Power plants
- Textile & Plastic
- Steel plants
- Sponge Iron plants
- Paper Machineries
- Mobile Hydraulic application

Planetary Gearboxes have much higher mechanical rating capacity compared to parallel shaft Gears. The power being transmitted gets equally distributed among three or five planets in each stage resulting in reduced induced stress which optimizes the size as well accommodates higher ratio.

### Significant advantages of Premium Planetary Gear Unit

- Compact design with optimum power density
- Long operating life
- Modular construction
- Interchangeability
- Less noise & vibration
- Ease of maintenance

### Description :

Premium Modular Planetary Gear Units covers nominal torque range between 55kNm. to 3600 kNm.

Foot and Flange mounting type planetary units are available with ring diameter upto 1930mm in double, triple and quadruple stage, depending upon ratio.

### Housings :

Heavily loaded housing parts are made out of spheroid graphite cast iron. Fabricated housings are also available on request.

## PREMIUM PLANETARY GEAR UNITS

### Gears & Pinions :

Sun & planet gears have spur gear teeth and are case-hardened and ground to precision grade accuracy with softer core provides improved wear and fatigue resistance.

Annulus gears are manufactured from high quality alloy steel, through hardened, nitriding depends on size & torque rating. Gear teeth are designed for long life fatigue resistance for the stated nominal torque.

### Bearing arrangement :

Planets and shafts are exclusively supported by amply sized antifriction roller bearings.

### Seals :

Input and output shafts have radial shaft seals. For special applications we provide seals with refillable labyrinth.

### Input Shaft :

Available features,

- Solid shaft with key
- Solid shaft with spline.
- Hollow with spline.

### Output Shaft :

Available features,

- Solid shaft with key.
- Solid shaft with external spline.
- Solid shaft with square end.
- Hollow shaft with internal spline.
- Hollow shaft with shrink disk.
- Hollow shaft with internal spline & bracket.

**Note: All internal and external spline available (as per DIN 5480) on request.**

### Lubrication :

The Gear units are provided with splash lubrication as a standard feature where in all parts to be lubricated are immersed in the oil.

In case, Gear unit requires force lubrication in condition of extreme ambient temperature or any other specific features, please refer to us.

The gear unit can be operated in any mounting position. In order to guarantee adequate lubrication; the mounting position must be stated.

## PREMIUM PLANETARY GEAR UNITS

### Direction of rotation :

The Gear Units are bi-directional refers to output shaft direction when viewing towards the shaft end face.

### Working temperature :

The working oil temperature of the planetary gears should range between +5°C to +90°C. Temperature falling outside this range could be accepted only if special lubricants, gaskets are used. For further information please contact us.

### Cooling :

Up to the limit of thermal capacity gear units are cooled by radiation and convection from the surface at the Housing/Casing.

### Operating condition :

The ambient temperatures must be known so that they can be taken into consideration while selecting the gear units for thermal conditions.

Where ambient temperatures are lower than -10°C. Please refer to us.

Environmental conditions such as salt water, salt-laden air, aggressive substances, dust, and mud falling or flying stones, excessive pressure, heavy vibrations and extreme shock loads must be disclosed.

### Delivery :

Premium Planetary Gear Units are supplied without oil. The Gear housing is protected against corrosion.

### Preservation :

Standard Preservation: up to 6 months with full of Oil and free run every alternate 20-25 days.

Long term: Up to 24 months full mineral Oil or synthetic oil on PAO basis is used ( PAO = American Petroleum base oil), and free run every after 20-25 days.

### Further notes :

For shaft mounted gear units with torque reaction arm, the connection of the torque reaction arm on the foundation must permit the gear unit to move corresponding to the displacement of the machine shaft at any time, without constraining forces acting on the gear unit. In case of foot mounted gear units with solid shaft the provided coupling between gear unit and prime mover must also be suitable for adequate misalignment.

### Explanation of symbols used in the dimensional drawings.

= Breather

= Oil drain

= Oil filler

= Oil sight glass

## PREMIUM PLANETARY GEAR UNITS

## Key to Symbols :

- $E_D$  = Operating Cycle per hours in %, e.g.  $E_D=80\%/\text{h}$ .  
 $f_1$  = Factor for driven machine (Table 1)  
 $f_2$  = Factor for prime mover (Table 2)  
 $f_3$  = Peak torque factor (Table 3)  
 $f_4$  = Thermal factor (Table 4)  
 $f_5$  = Utilization factor (Table 5)  
*i* = Actual Ratio.  
*i<sub>N</sub>* = Nominal Ratio.  
*i<sub>s</sub>* = Required ratio.  
*n<sub>1</sub>* = Input RPM  
*n<sub>2</sub>* = Output RPM  
 $P_G$  = Required thermal capacity (kW)  
 $P_{G1}$  = Thermal capacity (kW) for gear units without auxiliary cooling  
 $P_N$  = Nominal power rating of gear unit (kW) see rating tables  
 $P_r$  = Required power rating (kW)  
 $P_1$  = Motor power of driven machine (kW)  
 $P_2$  = Power Rating of driven machine (kW)  
 $P_{START}$  = Starting power rating (kW)  
*t* = Ambient temperature(c)  
 $T_A$  = Max torque on input shaft, i.e peak operating starting or braking torque (Nm)  
 $T_{2N}$  = Nominal output torque (Nm)  
 $T_2$  = Torque of driven machine (Nm)  
 $P_{2eq}$  = Equivalent power rating (kW)  
 $T_{2eq}$  = Equivalent torque (Nm)

## Gearbox Nominal Torque Rating :

Gear unit sizes	Nominal torque ratings (Nm)
20	57000
22	83000
24	120000
28	200000
33	335000
38	450000
41	595000
44	745000
48	948000
52	1165000
55	1320000
57	1550000
66	2530000
76	3600000

## PREMIUM PLANETARY GEAR UNITS

### Load Classification by application, Service Factors

Table 1 Driven Machines	Factor for driven machine			f1

50°C	0.55	0.58	0.84	0.74	0.98

Design for power rating of driven machine P2

\*Designed power corresponding to max. torque

\*\*Load can be exactly classified, for instance, according to FEM 1001

\*\*\*A check for thermal capacity is absolutely essential

\*\*\*\*Load can be exactly classified according to the slewing gear specification

The listed value of the factors are empirical. Prerequisite for their application is that the machinery and equipment mentioned correspond to generally accepted design and load specifications. In case of deviations from standard conditions, please refer to us.

For driven machines which are not listed in this table, please refer to us.

Table 5 Utilization factor f5								
30%	40%	50%	60%	70%	80%	90%	100%	
0.66	0.77	0.83	0.90	0.90	0.95	1.0	1.0	

## PREMIUM PLANETARY GEAR UNITS

### Gearbox Selection Guidelines :

#### 1. Determination gear unit type and size

##### 1.1 Calculation of required transmission Ratio:

$$i_s = \frac{n_1}{n_2}$$

##### 1.2 Determine the nominal power rating:

$$P_N \geq P_r = P_2 \times f_1 \times f_2$$

For  $f_1$  refer Table 1 and for  $f_2$  refer Table 2,  
If  $P_2$  is not available, use  $P_1$  in place of  $P_2$   
in the complete selection process.

##### 1.3 Check for over dimensioning:

$$3.33 \times P_2 \geq P_N$$

##### 1.4 Check for maximum Torque e.g.

Peak Operating-starting or breaking torque:

$$P_N \geq P_{START} = \frac{T_A \times n_1}{9550} \times f_3$$

For  $f_3$  refer Table 3

Gear unit sizes and number of gear stages are given in rating tables depending on  $i_N$  and  $P_N$

##### 1.5 Check whether the actual ratio 'i' as per tables on page 22 is acceptable.

#### 2. Determination of gear unit thermal capacity $P_G$

##### 2.1 Gear Unit Utilization for the determination of the thermal capacity:

$$\text{Utilization in \%} = \frac{P_2}{P_N} \times 100$$

For factor  $f_5$  corresponding to Utilization % refer Table 5

##### 2.2 Adequate for gear units without auxiliary cooling:

$$P_2 \leq P_G = P_{G1} \times f_4 \times f_5$$

For  $f_4$  refer Table 4 and for  $f_5$  refer Table 5

##### 2.3 For higher thermal capacities, forced lubrication system is available on request.

## PREMIUM PLANETARY GEAR UNITS

## Calculation Example 1

## Known Criteria

## PRIME MOVER

Electric motor	:	P <sub>1</sub> = 55kW
Motor speed	:	n <sub>1</sub> = 1500 rpm
Max. starting torque	:	T <sub>A</sub> = 560Nm
DRIVEN MACHINE		
Agitator	:	P <sub>2</sub> = 50kW
Speed	:	n <sub>2</sub> = 13.4 rpm
Duty	:	24 h / day
Starts per hour	:	1
Operating cycle per hour	:	E <sub>D</sub> = 100%
Ambient temperature	:	40°C

Installation in a large hall

## 1. Selection of gear unit type

## 1.1 Calculation of transmission ratio

$$i_s = \frac{n_1}{n_2} = \frac{1500}{13.4} = 111.9; i_N = 112$$

## 1.2 Determination of gear unit type

Type P3LA selected (for actual ratio, see page 22)

## 2. Determination of gear unit size

## 2.1 Determination of the nominal gear unit power rating

$$P_N \geq P_r = P_2 \times f_1 \times f_2 = 50 \text{ kW} \times 1.5 \times 1 = 75 \text{ kW}; \\ P_N = 82.5 \text{ kW} > P_r = 75 \text{ kW}$$

Selected from power rating table : type P3LA.

Gear unit size 20, with P<sub>N</sub> = 82.5 kW (see page 10)

$$3.33 \times P_2 \geq P_N \quad 3.33 \times 50 \text{ kW} = 166.4 \text{ kW} > P_N = 82.5 \text{ kW}$$

## 2.2 Checking the starting power rating

$$P_N \geq P_{\text{START}} = \frac{T_A \times n_1}{9550} \times f_3 = \frac{560 \times 1500}{9550} \times 0.5 = 44 \text{ kW}; \\ P_N = 82.5 \text{ kW} > P_{\text{START}} = 44 \text{ kW}$$

## 3. Determination of thermal capacity

## 3.1 Gear unit utilization

$$\text{Utilization in \%} = \frac{P_2}{P_N} \times 100 = \frac{50}{82.5} \times 100 = 60\%$$

3.2 Thermal capacity according to table for type P3LA  
(see page 10)

$$P_2 \leq P_G = P_{G1} \times f_4 \times f_5 = 51 \text{ kW} \times 0.71 \times 0.9 = 32.5 \text{ kW}; \\ P_2 = 50 \text{ kW} > P_G = 32.5 \text{ kW}$$

Auxiliary cooling required. Please refer to us.

## Calculation Example 2

## Known Criteria

## PRIME MOVER

Electric motor	:	P <sub>1</sub> = 90 kW
Motor speed	:	n <sub>1</sub> = 1000 rpm
Max. starting torque	:	T <sub>A</sub> = 1330 Nm
DRIVEN MACHINE		
Sugar Mill	:	P <sub>2</sub> = 80 kW
Speed	:	n <sub>2</sub> = 2.5 rpm
Duty	:	24 h / day
Starts per hour	:	1
Operating cycle per hour	:	E <sub>D</sub> = 100%
Ambient temperature	:	40°C

Installation in a large hall

## 1. Selection of gear unit type

## 1.1 Calculation of transmission ratio

$$i_s = \frac{n_1}{n_2} = \frac{1000}{2.5} = 400; i_N = 400$$

## 1.2 Determination of gear unit type

Type P4LA selected (for actual ratio, see page 22)

## 2. Determination of gear unit size

## 2.1 Determination of the nominal gear unit power rating

$$P_N \geq P_r = P_2 \times f_1 \times f_2 = 80 \text{ kW} \times 1.7 \times 1 = 136 \text{ kW}; \\ P_N = 155 \text{ kW} > P_r = 136 \text{ kW}$$

Selected from power rating table : type P4LA.

Gear unit size 41, with P<sub>N</sub> = 155 kW (see page 11)

$$3.33 \times P_2 \geq P_N \quad 3.33 \times 80 \text{ kW} = 266.4 \text{ kW} > P_N = 155 \text{ kW}$$

## 2.2 Checking the starting power rating

$$P_N \geq P_{\text{START}} = \frac{T_A \times n_1}{9550} \times f_3 = \frac{1330 \times 1000}{9550} \times 0.5 = 69.6 \text{ kW}; \\ P_N = 155 \text{ kW} > P_{\text{START}} = 69.6 \text{ kW}$$

## 3. Determination of thermal capacity

## 3.1 Gear unit utilization

$$\text{Utilization in \%} = \frac{P_2}{P_N} \times 100 = \frac{80}{155} \times 100 = 52\%$$

3.2 Thermal capacity according to table for type P4LA  
(see page 11)

$$P_2 \leq P_G = P_{G1} \times f_4 \times f_5 = 164 \text{ kW} \times 0.71 \times 0.83 = 96.6 \text{ kW}; \\ P_2 = 80 \text{ kW} < P_G = 96.6 \text{ kW}$$

No Auxiliary cooling required.

1) Shaft diameter tolerance as per IS: 3688 : 2006

2) For shaft end V1 & V2 with parallel key according to IS: 2048 : 2003 and Threaded Centre hole in shaft ends as per DIN 332/1

3) Up to 160 tolerance h6 and > 160 tolerance g6

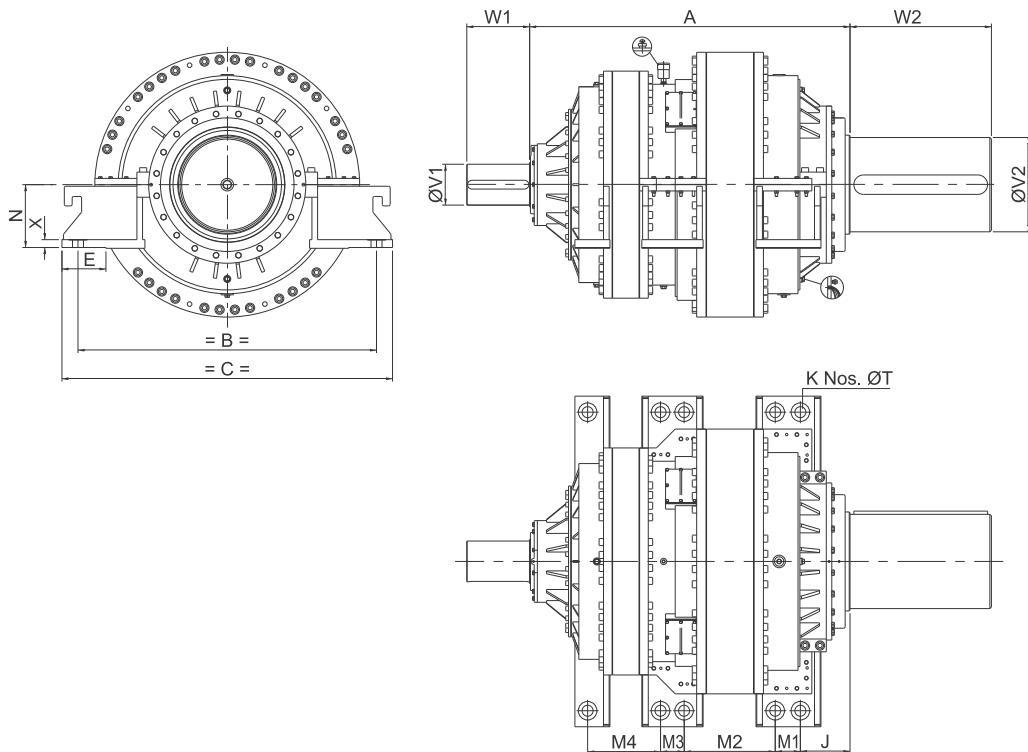

4) PTL can also supply gearbox with hollow input to suit Electric or Hydraulic motor flange

## PREMIUM PLANETARY GEAR UNITS

**Type : P3LA**

Three Stage Inline Flange Mounting Planetary Gear Units

Size : 20 - 38

### Dimensions

Gearbox Size	Shaft End Input Side				Shaft End Output Side				D (h7)	A	P	Q	S	Flange Bolts		Oil Quantity (Liters)

## PREMIUM PLANETARY GEAR UNITS

### Approved Lubricants

#### RECOMMENDED LUBRICANT

Premium Gear units are supplied without oil. Before operating it is essential to ensure that they are filled to correct oil levels as indicated by marking on dipsticks, with lubricants recommended by Premium. Overfilling can cause overheating and leakage.

Correct lubricant is most important and it should be noted that EP oils are recommended in all instances.

Lubricants listed are suitable for normal ambient temperatures and operating duties. All gear units are designed to operate under full load at maximum sump oil temperature of 95°C\*.

Where extreme conditions, are to be met, e.g. low temperature operation or unusual loading conditions, should be referred, with full details, to Premium for recommendations.

Recommended lubricants are based on information provided by oil suppliers and responsibility cannot be accepted for the quality or suitability of oil supplied, nor to any mechanical defect resulting from unsatisfactory lubrication due to the use of sub-standard oil.

#### Lubricant specification (CLP DIN 51517)

If the gear drive is started when the ambient temperature is below -7°C (20°F) use a lube oil heater.

## Product safety information

**General** - The following information is important in ensuring safety. It must be brought to the attention of personnel involved in the selection of Premium Transmission Limited power transmission equipment those responsible for the design of the machinery in which is to be incorporated and also involved in its installation, use and maintenance.

PREMIUM power transmission equipment will operate safely provided it is selected, installed, used and maintained properly. As with any power transmission equipment proper precautions must be taken as indicated in the following paragraphs, to ensure safety.

**Potential Hazards** - These are not necessarily listed in any order of severity as the degree of danger varies in individual circumstances. It is important therefore that the list is studied in totality :-

### 1) Fire/Explosion

- (a) Oil mists and vapour are generated within gear units. It is therefore dangerous to use naked lights in the proximity of gearbox openings, due to the risk of fire explosion.
- (b) In the event of fire or serious overheating (over 300 °C), certain materials (rubber, plastics, etc.) may decompose and produce fumes. Care should be taken to avoid exposure to the fumes, and burned or overheated plastic/rubber materials should be handled with rubber gloves.

### 2) Guards

Rotating shafts and coupling must be guarded to eliminate the possibility of physical contact or entanglement of clothing. Guards should be of rigid construction and firmly secured.

### 3) Noise

High speed gearboxes and gearbox driven machinery may produce noise levels which are damaging to the hearing with prolonged exposure. Ear defenders should be provided for personnel in these circumstances. Reference should be made to the Department of Employment Code of Practice for reducing exposure of persons to noise.

### 4) Lifting

Where provided (on larger units) only the lifting points or eyebolts must be used for lifting operations (see maintenance manual or general arrangement drawing for lifting point positions). Failure to use the lifting points provided may result in personal injury and/or damage to the product or surrounding equipment. Keep clear of raised equipment.

### 5) Lubricants and Lubrication

- (a) Prolonged contact with lubricants can be detrimental to the skin. The manufacturer's instruction must be followed when handling lubricants.
- (b) The lubrication status of the equipment must be checked before commissioning. Read and carry out all instructions on the lubricant plate and in the installation and maintenance literature. Heed all warning tags. Failure to do so could result in mechanical damage and extreme cases risk of injury to personnel.

### 6) Electrical Equipment

Observe hazard warnings on electrical equipment and isolate power before working on the gearbox or associated equipment, in order to prevent the machinery being started.

### 7) Installation, Maintenance and Storage

- (a) In the event that equipment is to be held in storage, for a period exceeding 6 months, prior to installation or commissioning, Premium Transmission Limited must be consulted regarding special preservation requirements. Unless

otherwise agreed, equipment must be stored in a building protected from extremes of temperature and humidity to prevent deterioration. The rotating components (gear and shafts) must be turned a few revolution once a month (to prevent bearings brinelling).

- (b) External gearbox components may be supplied with preservative materials applied, in the form of a "waxed" tape or wax film preservative. Gloves should be worn when removing these materials. The former can be removed manually, the latter using white spirit as a solvent. Preservatives applied to the internal parts of the gear units do not require removal prior to operation.
- (c) Installation must be performed in accordance with the manufacturer's instructions and be undertaken by suitably qualified personnel.
- (d) Before working on a gearbox or associated equipment, ensure that the load has been removed from the system to eliminate the possibility of any movement of the machinery and isolate power supply. Where necessary, provide mechanical means to ensure the machinery cannot move or rotate. Ensure removal of such devices after work is complete.
- (e) Ensure the proper maintenance of gearboxes in operation. Use only the correct tools and Premium Transmission Limited approved spare parts to repair and maintenance. Consult the Maintenance Manual before dismantling or performing maintenance work.

### 8) Hot Surfaces and Lubricants

- (a) During operation, gear units may become sufficiently hot to cause skin burns. Care must be taken to avoid accidental contact.
- (b) After extended running the lubricant in gear units and lubrication systems may reach temperatures sufficient to cause burns. Allow equipment to cool before servicing or performing adjustments.

### 9) Selection and Design

- (a) Where gear units provide a holdback facility, ensure that back-up system are provided. Failure of the holdback device would endanger personnel or result in damage.
- (b) The driving and driven equipment must be correctly selected to ensure that the complete machinery installation will perform satisfactorily, avoiding system critical speeds, system torsional vibration, etc.
- (c) The equipment must not be operated in an environment or at speeds, power, torques or with external loads beyond those for which it was designed.
- (d) As improvements in design are being made continually the contents of this catalogue are not to be regarded as binding in detail, and drawings and capacities are subject to alterations without notice.

The above guidance is based on the current state of knowledge and our best assessment of the potential hazards in the operation of the gear units. Any further information or clarification required may be obtained by telephoning or writing to:
